California State Library

EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General, and the Trustees of the Library.

MINING AND SCIENTIFIC PRESS.

Subscription, $5 Per Annum. Single Copies, 15 Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 4, 1868.

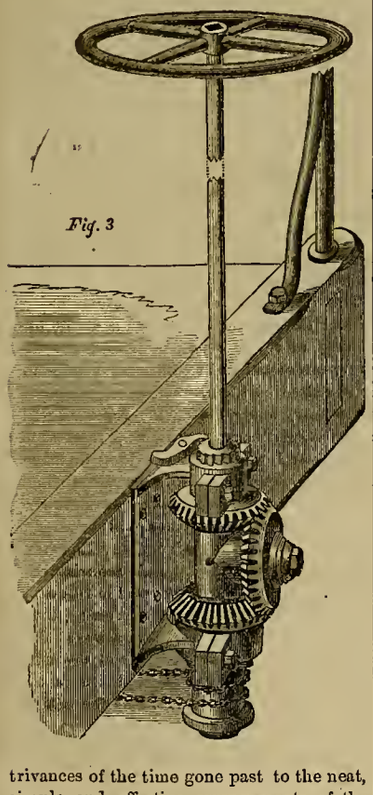
VOLUME XVII. Number 1.

Table of Contents.

Entwistle's Patent Method of Transmitting Rotary Motion—Illustrated.
Modern Book Manufacturing.
Our Mines.
The Chinese Empire.
Accidents by Blasting.
Furnace Improvements.
Uncertainties of Quartz Mining.
The Past and the Present.
Effect of Cold on Minerals.
California Academy of Sciences.
The Forthcoming Exhibition.
The Interior Press and the Exhibition.
Mechanics' Fair Rules and Regulations.
New Patents and Inventions.
Notices to Correspondents.
Stock Prices—Bid and Asked.
San Francisco Market Rates.
MECHANICAL MISCELLANY—The Durability of Metals; Magnet Test of Iron—the Other Side; Planing Machine Beds.
SCIENTIFIC MISCELLANY—The Heating Power of the Moon; Color in Astronomical Observations; Chemistry of Writing; Expansibility of Bismuth; Spectra of Meteors.
MINING SUMMARY—Comprising late intelligence from the various counties and districts in California, Colorado, Dacotah, Idaho, Montana, Nevada and Oregon.
San Francisco Mining Shareholders' Directory.
San Francisco Weekly Stock Circular.
New Incorporations—List of Officers.

Entwistle's Patent Method of Transmitting Rotary Motion.

A development of ingennity and a simplification of mechanical devices are everywhero apparent in the constructive world. We look from the old and cumbersome con-



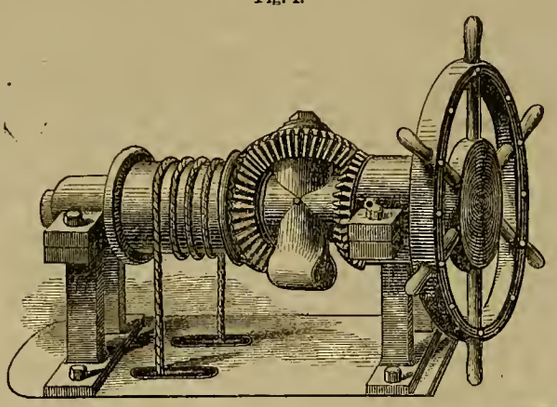


Fig. 3

trivances of the time gone past to the neat, simple and effective arrangements of the present day, and often almost involuntarily express surprise that the new idea had not been thought of before. We are forcibly reminded of this in viewing the method of transmitting rotary motion which we illustrate in this article. It is an arrangement of bevel-gearing by which rotary motion is increased or diminished in velocity on a single line of shafting. It accomplishes with three gears what has never before been accomplished on one line of shafting with that number. Two of theso gears have a common axis, and the axis of the third is radial to and revolves around tho first-named axis.

Fig. 1 represents an application of this invention to a steering apparatus, Fig. 2 to the rotation of a propeller, Fig. 3 its application to a ear-brake, and Fig. 4 as a means of operating drills with the bit-stock. Fig. 5 is a vertical section of the gearing of the steering apparatus. In this sectional view, A, A are the upright standards, such as are commonly used for supporting the wheel-shaft of a steering apparatus, as shown in Fig. 1. B is the horizontal shaft supported

Fig. 1.

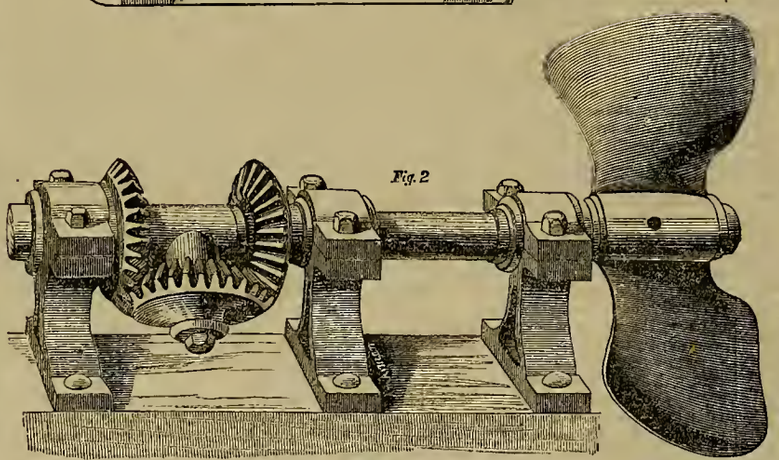

Fig. 2

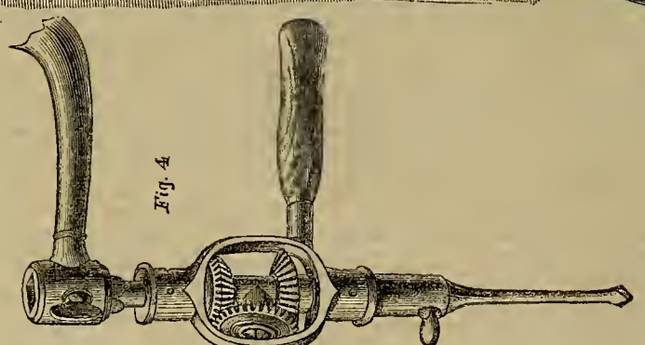

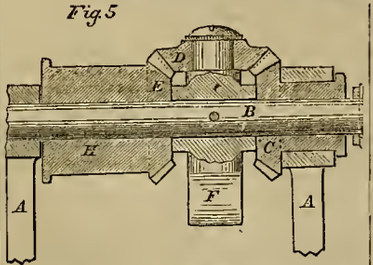

Fig. 4

Fig. 5

in the standards and turning with the wheel. The drum, H, is fitted to turn freely on the shaft, B, and the gear, E, is made fast to this drum, and turns with it. The gear, C, is made fast to the standard upon which it finds a support, and is a permanent fixture and not capable of rotation; the shaft, B, passes through this gear, the axial bore of which serves as a bearing for the shaft. Between the two gears and keyed fast to the shaft, is placed a hub which carries the third gear, D. This gear turns freely upon an axle which is made at an angle of 90° with the line of tho shaft. A counterpoise or weight, F, serves to balance the weight of the gear, D. The operation of the apparatus is as follows: the shaft, B, being rotated, carries the gear, D, and counterpoise with it in its revolution, and a motion is also given to the gear, about its own axis by its being engaged with tho gear, C. At the opposite point of the periphery to that which engages with C, tho gear, D, also engages the gear, E, attached to the drum, and the componnd rotation communicated to D gives a rotative motion to E in the same direction as the wheel and shaft, but at a velocity double that of the shaft. This double revolution is produced—owing to the gear, D, being made to operate as a lever of the third class—the fulcrum of which is at the pitch-line of the gear, C, the weight at E, and the power applied at the center of the axle of the gear, D. As the power is equi-distant between the fulcrum and the weight, the weight moves twice as fast as the power.

This same combination and arrangement of gearing may be applied for a great variety of purposes. On account of its compactness, it can be used with especial advantage for driving screw propellers at a higher rate of speed than the engine. In this case, the engine-shaft is placed in line with the propeller-shaft, the axle on which the gear, D, revolves is made fast to the engine-shaft, the gear, C, is fixed to the standard, and the gear, E, is firmly keyed to the propeller-shaft. If the gears are all of one size, two revolutions of the propeller are obtained for one of the engine-shaft. The compactness of the arrangement also renders it peculiarly applicable to railroad brakes, as shown in Fig. 3, and renders it a very convenient attachment to a bit-stock, as shown in Fig. 4.

In applying this motion to tho reduction of speed, the power would be applied to the gear, E, the rotary motion of which would cause the gear, D, to rotate around the axis of the shaft, and so creep aronnd the gear, C, and give rotary motion to any attached shaft at the rate of half a revolution for every revolution of E. In this operation the gear, D, operates as a lever of the second class, the fulcrum of which is at the pitch-line of the gear, C, the power being applied at the point of contact of the gear, E, the weight being at the axial center of D. As the weight is equi-distant between the fulcrum and the power, it only moves half as fast as the power.

It must not be understood that the sizes of the three gears are required to be uniform. Tho size may be varied, and the movement transmitted will be increased or diminished in velocity according to the relative size of the gears, C and E. If the gears, C and E, are not of uniform size, the axle of D will require to be set obliqne to the shaft, B, instead of the angle of 90°, as represented.

A patent for this method of transmitting motion was obtained on Sept. 14, 1866, by Thomas C. Entwistle, of New York city, and first illustrated in the *American Artisan* March 6th, 1867. For further information address the Entwistle Patent Transmitting Motion Association, No. 149 Water street, New York city.

Modern Book Manufacturing on an Extensive Scale.

The following well written description of the new printing house and bindery of D. Appleton & Co., in Brooklyn, N. Y., illustrates the rapid growth of the bnsiness, and contains many facts not generally known, which aro of interest to every reader.

As the visitor approaches the buildings from the direction of the Williamsburgh Ferry—five minutes' ride by horse-cars—his first impression is of a watch factory. It is all windows. Having suffered from the inevitable deficiency of light in New York, Appleton & Co. determined that the sun should turn his full eye on their business in Brooklyn. Besides the advantages of eomplete solar illumination for the finest kind of book-work, it is a good thing for the health and morals of artisans, and that was an important point. Sickly people may write books, but it takes well ones to print and hind them.

Kent Avenue, a wide thoroughfare, up and down which the cars run between the two divisions of present Brooklyn, fronts the pile. It is a goodly façade—the westorn one. Its general appearance is castellated. There are great tower-like structures at eaeh end, connected hy a less elevated range; and midway of the latter a mighty douhle gate of oak and iron, at which one looks to see a warder standing. This front is 200 feet. On Penn Street, to the south, the building is one story high, and extends 193 feet; on Hewes Street, north, it is four stories high, and 252 feet. When the contemplated additions are made, the Appletons will occupy a strongly-fortified quadrilateral, where they can hold out for an unlimited period against the severest siege of the hook-huyers. The entire area then enclosed will be 55,100 square feet, or one and a quarter acres. Of this the huildings, with all the projected improvements, will not occupy more than two-thirds—thus leaving in the eentre an ample space for the sunlight to rest and the winds of heaven to play in. Over a million cubic feet of space are ineluded in the buildings, as they now stand. So says the architect, and people generally will take his word for it, in preference to measuring for themselves.

A great factory, in which many different processes conduct to one eonclusion, is a piece of logie, which, to be understood, must be followed out from the heginning. Therefore, the visitor who would examine the Appletons' establishment intelligently, should eommence with the Printing-Houso to the right of the central gateway on Kent Avenue. Here, first is the "White Stock" Room, occupying a large part of the hasement. Thousands of reams are piled up, awaiting their turn, which will soon come, to he transformed, as by magic, into books. Beyond this department is a long stretch of vaults, as dark and snug, but not as damp, as the catacombs of Rome. This is the depository of all the stereotype plates of the house. They are packed into over 10,000 boxes, which are plainly labelled, and stowed orderly; so that, at a moment's notice, whenever the public demand a new edition of a book, the plates may be whisked out of their sepulchre and put upon the presses up-stairs. Iron doors and shutters, and thick hrick arches, make these vaults, with their precious contents, fire-proof.

On the first floor of the Printing-House, directly over the Paper-Stock Room, is a room for pressing paper. This is done by five hydraulie presses, of immense power, whose foundations are set in the solid ground heneath. By this process a eompact and glossy surface is imparted to the paper. To the right of this apartment is the Wetting-Room, where, hy machinery, the paper is dampened to the exact degree neeessary for fine presswork. Here again, as often happens, a combinatiou of wheels and levers performs a task better than a living hand, even the most intelligeut and faithful, could do it. Thus prepared, the paper is ready for the nineteen powerful steam presses, which are quietly elieking away in the next room. This apartment is 150 feet long, and 60 feet wide, very high, a mass of windows on each side, as well lighted as a Crystal Palace, and perfectly ventilated. Tho presses inelude varieties for every kind of work—the Adams, the Hoe, the Camphell, and French patterns. One sturdy little press is pointed out, which does nothing hut print Webster's Spellers. Year in and year out it labors unceasingly to meet the demand for that standard schoolhook, the first intellectual food given to Young America—a tender and appropriate nutriment, which the experienee of two generations has now eonfirmed as the hest, and which is not likely soon to he superseded. The iron-hearted little press will wear itself out, and be cast aside, and many others like it, long before Webster will go out of fashion. In moving about among this ingenious hut insensate machinery, one cannot help noticing the bright-looking girls who stand beside each of the presses, like a keeper beside an elephant, and fill its ravenous maw continually. The plumpness and rosiness of these nimble servitors proclaim the husiness to be healthful, at least as conducted in such well-lighted and airy rooms. Mr. Dunne, who has had charge of the Appletons' press-work for a long time, presides over the whole of this department, and sees that every sheet is perfect, before it is trundled over the little hridge which eounects the Printing-House with the Bindery.

Only one branch—the Drying Room—remains to be examined, in the dominion of Duune. This is a loft at the end of the Press-room. To this retreat the printed sheets are borne, damp and fragrant as newmown hay, and dried ou the same principle as a family-washing, but rather more scientifically. The outside air is freely admitted on all but the coldest days, and a temperature of ahout 70 degrees maintained hy steam-pipes.

Passing over the littlo drawhridge before mentioued, following a great load of Muhlhach ahead, and closely pursued hy the Dickens (cheap edition), the seeker for knowledge enters the Bindery, and the kingdom of Matthews, whose fortunes may be said to he hound up with the Appleton's. A polite pilot being placed at the visitor's disposal, he first descends to the hasement and looks at large piles of board and sheet stock and other material for covers. In a room adjoining this are odd lots of hooks, ten, or twenty, or a hundred, as the case may be, ealled the "overstock," representing the temporary excess of the supply of certain works over the demand. It is a wouder that the publishers hit the popular taste so closely. Great names are inscribed on some of the parcels; hut great names do uot always sell. The final destiny of the overstock is the paper-mill; much nohler, if one must choose, than going to the trunk-maker's.

Up-stairs, by the steam-elevator, to the first floor again. Hero is a room full of prints, some of tbem from the latest designs of the best artists of the Old and New Worlds, to be used in the illustrated works of the House; thence the explorer issues into an apartment so long that he can hardly see to the end of it. Soft throbs of machinery greet his ear, and, ou inquiry, he learns that a score of steam "folders" are performing their work with a speed and accuracy unattainable by human hands. This great room, too, is as light as day, and its atmosphere as pure as a garden's; and the 175 girls who feed the folders, or stitch the sheets when folded, or render other services on this floor, exhibit the bloom of health and the smile of eontentment.

The elevator again, and one is landed unfatigued on the second floor. A monotonous rattle, as of a steam chopping machine in full hlast, proves to emanate from a board-cutter, whieh being fed at one end with unlimited pasteboard, turus out 3,000 pairs of covers an hour, of any size wanted. This machine has a room all to itself. Next to it is the storage-place for the ealf, sheep morocco, and other leathers, and also the cloth for hinding; the whole smelling like a hran-new library. The rest of this floor is a duplicate, in point of size, of the one below it. About a hundred men are employed here, stamping, cutting, ease-making, and forwarding, which are various stages toward the consummation of the perfect work. Here are seen staeks of the Appletou standards, the freshest Muhlbach, the newest Dickens reprint, and other books "announced," and for whieh the orders are already pouring in. Looking, for a moment, at the quick motions of all these experts, it occasions no surprise to learn that 3,000 "Cyclopædias," 6,000 "Maria Antoinettes," 10,000 "Copperfields," and 15,000 or 20,000 small school-books, can be delivered from this department daily. Great as is the capacity of production, it seems to he fully tasked.

In just such another long, high, and admirably lighted room, on the third floor, are conducted the finer processes of gilding, marbling, and finishing. Here are men of ideas, of exeellent taste, of delicate touch, worthy to be called artists. Some of them originate heautiful desigus, in binding and ornamentation, as clover in their way as pictures and poems,—good ones we mean. The lovely work, for which Matthews has long been eelebrated, and which finds its highest expression in the famous gift-books of the House, is all done on this floor. Not less than $10,000 worth of gold-leaf is consumed here annually. It is a curious sight to see tbe skillful artist apply that most tenuous of substances to the lettering and embellishment of covers. Working in cobwebs, or the down of hutterfly-wings, could hardly be more difficult. Marhling, too, is a very interesting process. Drops of different-colored oils are swirled from hrushes hy a quick rotary movement hetween the workman's palms upon the surface of water in a trough. A rake with fine teeth is then drawn over the mottled surface hack and forth, and the oil-spots are hroken up and commingled into the most gorgeous symmetrical forms. Different combinations of colors, and different movements of the rake, produce totally different figures. The workman then takes a sheet of prepared paper between the thumh and the forefinger of each hand, drops it gently upon the colored surface of the water, and, a moment after, peels it off marbled. Each sheet requires the preparation of a new surface. To do this rapidly, and preserve a uniformity of pattern, demands great skill and experience in the operator. Science bas not yet been able to ahhreviate this rather tedious process.

Another and positively the last flight, by the elevator, lands the passenger on the fourth floor, the main part of which is devoted to packing Spellers, Cornell's Geographies, Quackenbos's Arithmetics, Harkuess's Grammars, and the other popular school-hooks of the House. About 15,000 Spellers are here hoxed and sent forth daily. At the beginning of the year, the demand for these Spellers poured in so thick and fast from all parts of the country (partieularly the South), that the Appletons were a half million copies in arrears; but, by steady pulling, night and day, they have eaught up, and are now prepared to fill orders with dispateh. This Packing-Room is one of the busiest places in the factory. Seventy-five men are here employed. Iu an adjaccnt room is a eurious machine, whieh should not be missed. It is a lithographic press, doing the same work as well by steam as it used to be done hy hand, and a great deal faster. On this press the maps for Appleton's Series of Geographies are printed.

In the eeuter of the ground, enclosed hy the buildings, stands the engine-house, where the motive-force is supplied by a splendid eugine of 80 horse-power. A carpenter's shop and a stahle for horses are eomprised among the other outhuildings.

For the present the type-settiug and stereotyping business of the House will he carried on in the Greene street building, New York, but it is intended eventually to remove those braneles to the Brooklyn establishment. For this purpose it will he neeessary, as previously intimated, to extend the accomodations on Hewes street, as well as to raise an additional story upon the huilding on Penn street. As the factory will be eonnected by private telegraph-wires with the Publishers' Offiee at their new Wholesale House, now completed, at the corner of Grand and Greene streets, New York, the same advantages will practically be enjoyed for the personal and sueeessful supervision of their business, as if all the departments were in New York and under the same roof.

Previous to fixing upon the plans of the Brooklyn structure, the leading printing-houses and hinderies of Europe were examined, with a view to incorporate their hest peculiarities in the new edifice; aud the result was the adoption of some of the hest features of the mammoth establishment of Mame at Tours, Franee (the model book-factory of the Old World), with a variety of original improvements, especially adapted to American usages and tastes. As a whole, it may eonfidently he asserted that the premises here described are without a superior, of their kind, in the world.

Good for Timber.—The Nevada *Gazette* says: "It has been asserted that the Pecan tree, which is so valuable, not only for its fruit hut for its timber, which can he made into excellent spokes, felloes and ax handles, will not grow in California. Last Saturday we saw one growing in the garden of Mons. Charonnat, in this couuty. It was planted from a nut in 1863, and is now thirteen feet high and eighteen inches in diameter. Its boughs are filled with fruit, and it gives a most heautiful shade. It is plain to our mind, that in the Sacramento Valley, in sueh parts as are not subjected to protracted overflow, it can be made to attain a much greater growth than in this eounty, where the winter frosts are severe. The value of the wood for manufacturing purposes cannot be over-estimated.

The English in India.—The total number of Englishmen in British India is only 150,000. Of these 58,000 are soldiers and officers; 3,500 civil and ecclesiastical officials, and the remaining 89,000 are engaged in trade and various occupations.

Our Mines.

The second quarter of the year closes under circumstances most favorable to the general industrial interests of the State. The severe and prolonged storms of last winter for a season entirely stopped all placer mining operations, and caused considerable damage to flumes, ditches, etc., so that it required some time after the winter season to repair and again put in working condition many of our best paying claims. Calaveras, Nevada and Sierra appear to have suffered more from the effects of the severe winter than any other of our mining counties. Yet, as far as we have learned, all damages bave heen repaired and tbe elaims are again turning out their nsual quantities of treasure. During the latter part of the season all of the placer elaims in the State were favored with an ahundant supply of water, and as a consequence that particular branch of mining was carried on with more than usnal suceess. The reduction in the price of water in Nevada and other counties greatly contrihuted to the prosperity of the mining interests, and more than usual activity has prevailed.

In quartz miniug the showing is far hetter than for the previous six months. New ledges bave been discovered in various localities throughout the State, which in some instances have proved to be extraordinarily rich. Mining generally has settled down into a regular busiuess, and parties owning even fair ledges, seem content to eoutinne upon and work them for what they are worth. This disposition was evinced by the very few persons who left this State during the Sweetwater exeitement. The miners of California learned long ago that success in their particular business never courted the "rolling stone." The quartz interest is one of vital importance to the State, and wherever we find a succcssfully operated and paying quartz lead, wo are sure to find activity and life in all other hraucbes of business. No scarcity of hands has prevailed, as the disposition of so many people in the East to rush to California, owing to the low price of fares, bas more than supplied the State with laborers, a great many of whom we may reasonably suppose will take np the business of mining either for themselves, by locating and opening up new ledges, or by hiring out to work on ledges already developed.

The importance of thoroughly opening up and developing our mines is daily beeoming more apparent, hoth to those directly interested and to those who hope to be benefited by them. The development of tbe country along the Pacific Railroad will bring to light many new items of interest to miners, and elose up the long distanee which they have heretofore been compelled to pass over to prospect and examine the eountry. The consequence will be a long line of indnstrious miners, leveling the hills, tunneling the mountains, scouring out the gulches, and throwing out the resnlt of their labor to enrich tho whole country, thus preparing the way, as they always do, for the farmer, the meehanic, and the artisan. In view of these facts, thero is no douht hut that California, being the eenter of mining interest, and San Franeisco the great western terminus, they will receive the greatest henefit arising from such a state of affairs.

Fortunate.—Only one vessel of the great fleet of over 200 sail which left this port during the year 1867, has failed to arrive at their several ports of destination. Tho missing one is the Ellen Sears, which has now heen nearly one year out for Liverpool, and is generally given up as lost.

First Shipment.—The first shipment of sixteen flasks of quicksilver, was received in this city last week from the newly opened Phœnix mine, in Pope Valley, Napa eounty. There is said to he ore enough out to supply the works for three months. This, we believe, is the first shipment of quicksilver from any of the Napa eounty mines.

Mechanical.

The Durability of Materials.

A very interesting paper was read by Mr. Edwin Clarke before a late meeting of the London Institution of Civil Engineers, on "Durability of Materials," from which we condense as follows: The list of materials used by the Engineer is small. It includes stone and timber among natural productions, and bricks and cement and the metals among artificial products. It is difficult to state, even approximately, the positive life of either of these articles. The durability of any material depends, not merely on its own inherent properties, but principally on the agencies to which it is exposed; as, for instance, the effects due to climate.

On examining all the facts and seeking some common characteristic, it is found that among all the causes of decay, humidity holds the first rank. The decaying influence of humidity was evidently dependent on other coincident circumstances. The mere pressure of water, or even of a saturated atmosphere, is not sufficient to induce rapid decay, which appears to be caused by humidity only under peculiar conditions. One of these conditions is well known by the popular title of dampness. The decay caused by dampness, as in the case of dry-rot, is effectually prevented by the presence of water or by a constant current of air, whether perfectly dry, or saturated to any degree of humidity. Dampness, therefore, is not the mere presence of moisture in the ordinary form in which it is held in solution by the atmosphere. If an hygrometer were placed in a damp situation it would simply indicate perfect saturation; no evaporation would take place, but the cotton covering of the wet bulb will be speedily covered by a peculiar mould, well known by its fungus-like odor, and in a short time it will be converted into an impalpable powder, or ash. Under similar circumstances timber, leather, paper, and all like materials undergo the same rapid decomposition; vegetable gums and oils, that are insoluble in water, and even dry hard paints and varnish, become soluble and liquid. Massive timbers are rapidly disintegrated, entirely losing their weight, though still retaining their form; and they are often totally free from apparent moisture, although at times dotted externally by drops of brilliant water. Damp spots are, moreover, peculiarly hygrometic, indicating atmospheric changes with remarkable precision, and temporary desiccation in no way disturbs this process. The peculiar odor which always accompanies this condition is one of the best tests of its existence; and the expression that a room smells damp is strictly correct. The effect is, within certain limits, intensified by increase of temperature and absence of light, and arrested by poisons destructive to vegetable life.

If this phenomenon of decay is more closely examined the process would be found to resemble, in many respects, a slow combustion. The ultimate results of combustion and decay are strikingly similar; the union with oxygen is slowly effected, and the residue is more or less diluted with foreign substances; but whether bodies are burned or decayed the remains, in the ashes, are substantially identical. Decay may thus, to a great extent, be looked upon as a decomposition, resulting from the slow chemical combination of oxygen with the matters decomposed. Now, if slow combustion is the cause of decay, and that particular state called dampness is so important an accessory, the inquiry naturally suggests itself: What connection exists between those agencies, or in what way can damp promote the absorption of oxygen?

In the case of organic substances, the presence of vegetation in the form of fungus, or mold, is an invariable characteristic of decay, and the decomposing effect of all vegetable growth is beyond question. It may be said, that the vegetable growth alluded to is the effect rather than the cause of decay. Doubtless, the spores of microscopic fungi followed the law of all other seeds in vegetating only under the peculiar conditions of soil, light, and moisture which were adapted to their growth; dampness and partial darkness, and absolute quietude, and even decay, may be essential to their existence; and, therefore, it is only under such conditions that they appear at all. But, nevertheless, when they do appear, their presence rapidly accelerates decay, and they furnish a vital medium, capable of accomplishing the observed effect—combustion, or slow union with oxygen, of the substances on which they thrive.

It is probably by some such chemical vital action that the fact can be explained, why even the hardest rocks are rapidly decomposed by the growth of lichens, or that decay should be arrested by poisons which could exert no other influence than the prevention of vegetation. It was equally remarkable that in the putrefaction, or rapid chemical decomposition of animal and vegetable substances the same profusion of the lower forms of animal, as well as vegetable, organisms characterize the phenomenon.

Whatever may be the cause of decay, moisture is an indispensable element. Dry air is incapable of decomposition. Water is a carrier of oxygen in a potent form; and it was only from water, and more especially when in the form of vapor, that the oxygen necessary for decay can be obtained. The durability of tin and iron roofs in Geneva and St. Petersburg is due to the absence of moisture; and the importance of some shelter for timber, and of thorough ventilation, wherever it is employed in a moist climate, is a necesssry corollary.

We shall next week continue our notes on that portion of the paper of Mr. Clarke, wherein he speaks of the durability of metals.

Magnet Test of Iron--the other Side.

Mr. John Farquharson, of Her Majesty's Dock-yard, Sheerness, sends a paper to *Engineering*, in which he takes a different view of the above-named subject from that advanced by Mr. Saxby, of whose conclusions we gave a summing-up two week since. It will be remembered that one of these conclusions was, that free magnetism was not confined to the surface of a body, but distributed throughout the mass. Mr. Farquharson, after refuting certain other positions by Mr. Saxby, takes up this one, and closes his paper with the following remarks upon it:

"The amount of free magnetism in iron is not directly as the mass, nor exactly as the surface, although nearly so. Barlow found that a sbell 10 in. in diameter and 1-36 in. thick, had two-thirds the magnetism of a solid sphere of that diameter; and according to Poisson's formulæ, a cylinder 10 ft. diameter and 4½ in. thick has as much free magnetism as a solid cylinder of that diameter; but it has been objected that this is only true when the continuity is regularly interrupted—a condition not to be anticipated in actual practice, and I have endeavored to test this experimentally with the following result: A cylinder 4 in. long, 2 in. diameter, and ¼ in. thick had a cylinder of iron borings roughly fused together by molten iron inserted, and slowly revolved within the hollow cylinder; the needle was perfectly steady and unaffected. The like result followed the substitution of a solid and also the half of a solid cylinder of the same description of iron for the rough cylinder of borings, the deflection in either case remaining the same. It appears, therefore, that the free magnetism acting upon a needle is due to a stratum of iron near the surface, and that considerable irregularity in the internal structure of a bar of iron 2 in. thick may exist without affecting the needle. But the practice, so far as I have seen, is to use a very light needle near the surface of the iron, and to disregard altogether the inductive influence of the needle. Now a cylinder of the thinnest iron that can be produced will deflect a needle so used 90°; a solid mass can do no more, and I can see no reason why we should not find the same varieties between this and the neutral point, where deflection is nil. We must, therefore, it appears to me, remain quite uncertain as to the condition of the internal mass at a greater distance from the needle."

PLANING-MACHINE BEDS.—An idea has been advanced that the beds of planing machines should be reversed once a year where their construction permits it. This will equalize the wear of the slides and make them truer than they would otherwise be. Carelessness will often in twelve months so injure a planing machine that nothing will cure it but being made over. If, however, the artisan be up to his business, he will so arrange his work on the bed that it will wear true at all times; if he is obliged to work any length of time on one end of the bed, he ought to divide the periods so as to run first one end of the platen over the slides and then change the other end. In this way the best results will be obtained.

Scientific Miscellany.

The Heating Power of the Moon.

Mr. Harrison recently read an interesting paper before the British Royal Astronomical Society on the capacity of the moon to receive heat from the sun and to radiate the same into space. Assuming that the lunar surface has a capacity for heat, equal to the surface of the earth, that luminary must, during its long lunar day, of nearly fifteen of our days and nights, store up on any given surface exposed to the action of the sun's rays during that length of time, a very large amount of heat.

The moon's hemisphere, visible to us, would be heated to its greatest possible extent during the third or last quarter, when the half moon thus illuminated has been subjected to the effects of solar radiation for a mean duration of about eleven days, and the remaining half, then in shade, has recently been receiving the sun's rays for a period of equal duration. Hence, if the moon radiates heat as far into space as to reach the earth, it would be at that time that our planet would be receiving its maximum of heat from its satelite.

Now the heat thus assumed to be acquired by the moon, and radiated into space, is dark heat; and as it is known that the aqueous vapor in the atmospbere has a power of absorbing dark heat, says Mr. Harrison, hence, the heat radiated by the moon, instead of conveying warmth to the earth's surface, is employed in heating the aqueous vapor in the atmosphere above the clouds. The clouds would thus be raised to a higher elevation, and of course to a greater or less extent dissipated. There would also be a sensible fall in the temperature near the earth's surface caused by such evaporation or rarification. Mr. Harrison further stated in his paper that the daily mean temperature at the Oxford, Berlin and Greenwich observatories, when reduced to tables, according to the age of the moon, show that the temperature of the air near the surface of the earth is affected by the moon in the manner above described; and that the maximum mean temperature occurs about the seventh day of the lunation, and the minimum after the full moon. These results, if as stated, would be remarkably confirmatory of Mr. Harrison's views.

We may here remark that the editor of the London *Quarterly Journal of Science*, differs from Mr. H. The editor holds that the moon *does* indeed exert a marked influence, but *not* for the reasons assigned by Mr. Harrison; but because that influence is exerted (in consequence of the varied times at which the moon reaches her meridian) at more or less favorable hours of the day—such hours as those in which the hygrometrical state of the atmosphere, which varies at different hours of the day, is most favorable for the development of such phenomena.

As respects the heating of the moon's surface, the *Quarterly* remarks that, although there is undoubtedly an enormous quantity of heat poured upon a lunar hemisphere, in the course of the long lunar day, yet we have no means of knowing how that heat is disposed of. Nearly all of it may be radiated into space, or a large portion may be consumed in effecting changes—as of solid into liquid, or of liquids into vapors—followed by a return to the original state during the equally long night which follows. The *Quarterly* thinks it hardly possible that the heat stored up in the moon during its day, becomes sensible to us, by radiation, during its following night; but rather far more probable that the heat we actually receive from the moon is from reflection, precisely as we receive her light.

IT has been found that steel rifle-barrels when fired off several times in a northerly direction, acquire magnetic properties.

COLOR IN ASTRONOMICAL OBSERVATIONS. Mr. J. Browning, F. R. A. S., has published a paper in the *Chemical News*, in which he shows quite conclusively that the difference in the apertures of different telescopes affects materially the appearance of the heavenly bodies to the observer. The color of a given star, or of the moon during an eclipse, etc., appears very different to the observer when he changes his telescope from a four to a six or seven inch aperture. From this it follows that the estimate of colors, in astronomical observations, must be coupled with the diameter of the aperture of the telescope through which the observations are made. For instance, the small star in the cluster *Perseus*, appears of an indigo-blue with an 8¾ inch, Prussian-blue with a 10¾ inch, and royal-blue with a 15¼ inch aperture. This discovery accounts for some most singular discrepancies noticed by observers, which have heretofore been attributed to color blindness.

CHEMISTRY OF WRITING.—Writing ink, with trifling variations of proportions, is a compound of sulphate of iron, extract of galls, and gum, held in mechanical union by soft water. When the fluid is applied to the paper, the following chemical action occurs: The oxygen of the atmosphere forms gallic acid with the tannin of the galls, which, in turn, unites with the iron in solution, forming a black precipitate (the per-gallate of iron), and the sulphuric acid, thus set free, enters the body of the paper, while the water passes off by evaporation. When the presence of this sulphuric acid in the tissue of the paper is in excess, the paper is gradually destroyed. It should be the aim to obtain an ink which will leave the least acid in the tissue, and still give a permanent black color.

EXPANSIBILITY OF BISMUTH.—Bismuth is a metal which, unlike other metals, expands on fusing or cooling. Mr. A. Tribe recently read a paper before the London Chemical Society "on the Freezing of Water and Bismuth," in which the author made mention of a series of experiments which proved that, although bismuth, like water, increases in bulk on freezing; yet this increase is only at the moment of congelation. This is no evidence that, as is the case with water, any expansion takes place before solidification.

SPECTRA OF METEORS.—Mr. Browning has invented an ingenious contrivance for reducing the angular velocity of meteors so as to enable him to obtain their spectra. With this device he has found it easy to obtain the spectra of balls shot from a Roman candle—the characteristic lines of baryta, strontia, etc., can be readily distinguished in their spectra.

BLOW-PIPE BEADS.—Prof. G. Rose has studied some curious phenomena exhibited by certain blow-pipe beads. He finds that the opacity which they frequently assume on cooling, results from the separation of microscopic crystals. The Professor's researches on the reaction of titanic acid appear to have some bearing on the natural formation of anatase.

THUNDER MADE VISIBLE.—Dr. Topler focalizes a ray of light on the object-glass of a telescope, which is connected with a screen in such a way that any disturbance of the air becomes visible; for instance, the intense sonorous vibrations of the atmosphere produced by electric explosions show themselves in the telescope as visible rings or circles of light.

DISCOVERY IN MAGNETISM.—M. Gerard has discovered a very curious fact. If a metallic ring made of wire, the diameter of which varies regularly, so that at one side of the ring it is very thin and at the other side relatively very thick, be suspended over an electro-maguet, it will begin to revolve. The author sees in this fact the germs of a new system of electric telegraphy, for the details of which we wait.

EFFECT OF COLD ON MINERALS AND OTHER SUBSTANCES.—Two or three weeks since we gave some account of the effects of extreme heat on minerals and metals; it may interest some of our readers to know the effects of cold upon various substances. For every mile that we leave the surface of the earth, the temperature falls five degrees. At about forty-five miles' distance from the earth, we enter, strictly speaking, into the regions of space, whose temperature is 225 degrees below zero; and here cold reigns in all its power. Some idea of this intense cold may be formed by stating that the greatest cold observed in the Arctic circle is only 40 to 60 degrees below zero; yet here many surprising facts are produced. In the chemical laboratory, the greatest cold that we can produce is about 150 degrees below zero. At this temperature carbonic acid gas becomes a solid substance like snow. If touched, it produces just the same effect on the skin as a red-hot cinder; it blisters the finger like a burn. Quicksilver freezes at 40 degrees below zero; that is, 72 degrees below the temperature at which water freezes. The solid mercury may then be treated as other metals, hammered into sheets, or made into spoons; such spoons would, however, melt in water as warm as ice. It is pretty certain that every liquid and gas we are acquainted with would become solid, if exposed to the cold of the regions of space. The gas we light our streets with would become wax; oil would be in reality as hard as a rock; pure spirit, which we have never yet solidified, would appear like a block of transparent crystal; hydrogen gas would become quite solid, and resemble metal; we should be able to turn butter in a lathe, like a piece of ivory; and the fragrant odor of the flowers would have to be hot before they would yield perfume. These are a few of the astonishing effects of cold.

IMPORTANT WORK ON MINERALOGY.—It is important to every science that its literature and progress should be frequently collected, classified and epitomized to the end that the student of such science should have always at hand a convenient record of its progress down, as near as possible, to the time at which he is engaged in his studies. In 1843, Von Haidinger, of Vienna, undertook such a task, and prepared a report on mineralogical progress of that year. His work was followed by the labors of Dr. Kenngott, who published yearly records, at brief intervals, down to 1861, since which time nothing of the kind has appeared. So much had the want of such a publication began to be felt, that in 1865 the Imperial Academy of Sciences, at Vienna, offered a prize of 1,000 florins for a record of mineralogical progress from 1861 to 1865. It has recently been announced that this labor has been undertaken and accomplished by some diligent German compiler, to whom the above-mentioned prize has been awarded, and that the desired work will soon appear. It will no doubt be promptly translated into English, and much sought after.

THE BEETLES OF UTAH.—Utah seems to be plagued with an insect of most unusual proportions, which the residents have called the "elephant beetle." From the accounts given, it appears to be quite a formidable insect. They are described as being of a shining, brownish-black color, about four inches long, with legs three inches in length. They completely cover the earth in some places, destroying everything in their path,—even small animals are sometimes covered by them, worried to death and devoured. They will soon consume the carcass of either a sheep or an ox. They eat their own dead. Unlike other beetles, they possess the faculty of uttering a loud sound, which, when uttered by countless thousands, is sufficient to frighten horses and other animals. The account before us seems to have been drawn with a pretty long bow; but we give it in substance as we find it. A gentleman of Salt Lake was about to send specimens to some scientific gentlemen at the East for examination. It might be well to send some to this city also.

California Academy of Sciences.

SPECIAL MEETING.

MONDAY EVENING, June 29, 1868.

This meeting was called for the special purpose of considering the advisability of accepting a block of land offered by the Paul Tract Homestead Association, on the condition that the Academy expend $15,000 in putting up a building or otherwise improving the same. After considerable discussion, *pro* and *con*, it was voted inexpedient to accept the proposed donation. The land was considered to be too far out of the city to be of any value to the Academy for the purposes proposed. The Secretary was instructed to address a letter of thanks to the Association thanking them for their liberal offer; but declining to accept it for the reasons stated.

H. P. Livermore, Dr. R. H. McDonald, James Deering, and J. S. Phillips, M. E., were elected members.

Mr. James Brooks was elected Secretary in place of Mr. Bradley, resigned.

DONATIONS TO CABINET.

A skull found in Arizona was presented on behalf of P. W. Randall. The skull was obtained from a grave near extensive ruins at the junction of the Salt and Gila rivers. The ruins are quadrangular in form, and are estimated to cover an area of 300 by 250 feet. When the grave was opened, the lower section of an "ogee," or earthen water jug, was found inverted over the skull. It seems to have served the purpose of preserving it, for the rest of the skeleton was so decayed as to render it almost impossible to trace it. Dr. Randall states that the skull bears no resemblance to those of any of the Indian tribes in that region, and he is of the opinion that it is several centuries old. The Indians who examined it said that it was not of their tribes, but was a "Montezuma," though their opinion in the matter is of no value.

Dr. Kellogg presented a fine specimen of the long spike, or fruit stem of the celebrated grass tree *(Xanthorrhea hastelis)*, from Hon. George Hobley, of Alameda. The aborigines of Tasmania beat off the beads of these singular trees or plants, by striking them with a pole near the top of the trunks. They then strip off the outer leaves, etc., leaving about an inch and a half of white, tender, milky portion, next the trunk. This is eaten raw, or roasted, and has a nutty, balsamic flavor. The fibers of the leaves are exceedingly strong, but have failed in rope making, as they refuse to remain twisted like flax, etc.

The meeting adjourned at ten o'clock, the President announcing that next Monday he should address the Academy on *The Chemistry of Digestion.*

CATCHING AND BREEDING FISH.—The Sacramento *Bee* complains that, in defiance of law, people are largely engaged in various parts of the State trapping and otherwise catching trout. A stop should be put to such operations during the spawning season. The *Bee* alludes at considerable length, to the efforts made in the Eastern and Northern States to keep the rivers stocked with fish, and to fill such as are not so stocked, by artificial breeding. Allusion is also made to quite an extensive attempt at artificial breeding, at a point in the foothills, just back of Oakland, with the remark that the dams, etc. connected therewith had been washed away, thus destroying the enterprise. We presume allusion is made to the enterprise of Mr. M. Disney, a well known mechanic of Oakland; but we think the *Bee* is mistaken with regard to the extent of the damage. We were informed by Mr. D. a few days since, that his fish were doing well and that he had great numbers of them. We believe this is the only attempt at fish breeding, on any considerable scale, in this State. The spawn were obtained from Lake Tahoe. There are many streams in the foothills where the water is not disturbed by miners, or filled with the poisonous sawdust from the red wood sawmills, which might be easily stocked with trout; and wherever ponds could be provided, such enterprises might be made most profitable investments. A very small amount of capital only is needed for such an undertaking.

We understand that C. Muller, optician, 205 Montgomery street, has been appointed sole agent for the Improved Eye Sharpener, patented by E. B. Foote, M. D. *

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

ISSUED FOR THE WEEK ENDING JUNE 16, 1868.

78,928.—IMPROVEMENT IN ORE ROASTING FURNACES.—David C. Collier, Samuel Cushman and Newel E. Farrell, Central City, Colorado:

1. An apparatus for roasting and chloridizing ores, composed of a cylinder A, rotating on an axis inclined to the true axis of the cylinder, within which, in the line of the rotating axis, is a partial partition for receiving and retaining the ore for a short time at each semi-rotation of the said cylinder A, in combination with a fire box J and flue K, substantially as shown and described and for the purpose set forth.

2. The wheels B, in combination with a rotating cylinder A, substantially as shown and described and for the purpose set forth.

3. The partial partition in a plane in the center of the rotation of the cylinder A, and placed at right angles to a line drawn from the manhole, H or I to said partition, or its equivalent, and in combination therewith and with any fire-box J, substantially as shown and described and for the purposes set forth.

REISSUE.

2,991.—IMPROVEMENT IN GANG PLOW.—Wm. B. Ready, Sacramento, Cal. Patented Dec. 3d, 1861.

I claim 1st. The curved beams A, when used in connection with a gang plow, or a series of plows connected together by cross-bars B, B, B, constructed and operating as and for the purposes herein set forth.

2d. The arrangement of the arms C, wheels I, and lever J, when attached to the right hand arms t, and connected to the central beam A, as and for the purposes set forth.

RECENT INVENTIONS.

GATE FOR MINING GALLERIES.—Mr. Frank Thayer, engineer of the Savage Works, says the *Territorial Enterprise*, has just added to the list of his ingenious contrivances a self-acting gate, which closes the approach to such compartments of a mining shaft as it may be fixed upon. The gate is made of wood, and strengthened with light straps of iron. At either side it fits into grooves, in which it moves up and down. Every year a number of men have been killed in our mines by pushing cars into shafts when no cage was up to receive them,—hence the necessity for the self-acting guard gate. When it is used a car cannot be pushed into the shaft. When the cage is in place ready to receive the car, the gate is always open and always shut when the cage is down. The gate is lifted up by the top of the cage-frame as it passes up, and let down and left across the track leading to the compartment as the cage descends. Workmen may be absent-minded, but the gate never forgets its place. The new gates are now in operation at the Savage works. They cost but a trifle, and should be used in all the levels as well as upon the surface. They are extremely simple and not liable to get out of order.

Mr. Thayer is the inventor of the telegraphic mining signal, elsewhere noticed in to-day's issue. His fertile brain has produced many new and important devices for simplifying and rendering more safe the dangerous and laborious occupation of the miner.

NEW SHORT-HAND SYSTEM.—It is said that a Mormon genius, named Shelton, has invented a new system of short-hand writing, which it is claimed is destined to completely revolutionize the phonographic art. The advantages claimed for the new system are, simplicity, facility of acquirement, brevity and reliability. It can be written, the inventor claims, in half the space required for the Pitman system, which is the one in universal use now among reporters.

CITY GARDENS.—A grand promenade moonlight concert will be given this (Friday) evening, at this favorite place of resort. The grounds, which are particularly attractive at this season of the year, while the flowers are in bloom—illuminated as they will be with one thousand Chinese lanterns—will present a scene of almost Oriental magnificence. There will be music by the Chris. Andres' Band of twenty-five of the best performers of this city, led by Prof. Herold, the renowned operatic leader. A concert will be given on the afternoon of July 4th, and another on Sunday, at 10 o'clock, P.M. See programme elsewhere.

Notices of Recent Patents.

78,597.—IMPROVED SHOE FOR SEPARATORS. Michael Laufenburge, Two Rocks, Cal.:

What I claim is the combination of the screw I, with the inclined sieves C and C', vibrating in alternation, substantially in the manner and for the purposes herein described.

This invention is intended to be used as a substitute for that part of a threshing machine called the shoe, and consists in placing the sieves in the frame at an incline, where they are driven to and fro on ways, by means of rods attached to a horizontal eccentric driving-shaft. Beneath the shaft is a horizontal screw, which conveys the tailings to elevators in a uniform manner. In using this device the grain that does not pass through as it falls upon the top of the sieve, is carried, by the shaking motion imparted by the eccentric-shaft, to the edge of the screens, and falls down into the oval trough, and is carried out by the rotating screw, through an opening made in the end of the trough into an elevator. By this means a device is obtained for shaking the sieves, without creating any jars on the frame of the machinery, and the whole space between the sides of the frame is occupied; thus increasing the capacity of the sieves for cleaning the grain which is not the case when a to-and-fro, combined with a slide motion, is imparted, as in ordinary shoes. The augur, or screw, conveys the tailings into elevators in a very uniform manner, and will not choke up when damp grain is being threshed, as is invariably the case when small troughs are employed. This machinery may also be set to work in a much less time than other machines are, as it requires no staking or bracing.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

AUZANZA WATER CO.—Los Angeles, June 27th. Capital stock, $100,000; 2,000 shares, $50 each. Trustees: F. L. A. Piocbe, L. L. Robinson and A. Caselli.

GOLDEN GATE M. CO.—Calaveras county, June 27th. Capital stock, $17,550; 3,510 shares, $5 each.

GLENWOOD M. & M. CO.—El Dorado county, June 30th. Capital stock, $80,000; 80 shares, $1,000 each. Trustees: A. H. Jordan, Wm. Vale and J. H. Wood.

THE following articles of incorporation have been filed in the office of the Secretary of State during the past week.

SAN JOAQUIN FARM HOMESTEAD ASSOCIATION.—June 28th. Merced and Fresno counties. Capital stock, $200,000; 500 shares, $100 each. Trustees: A. S. Gould, O. P. Fitzgerald, H. F. Williams, George Hearst, Wm. H. Bryan, C. W. Stevens, R. M. Widney, C. H. Pollard, J. W. Pearson, W. D. Garland and G. Holland.

Advertising and Subscription

Rates for the Mining and Scientific Press.

Subscriptions in Advance.—One Year, $5; Six Months, $3; Single Copies, 15 Cents; two Copies, 25 Cents. Monthly Series, $5 per annum.

Lowest Rates for Advertising:

We shall adhere to the following rates (payable in gold coin) for advertising in the MINING AND SCIENTIFIC PRESS from this date:

One column, one year	$400 00
Half column, one year	220 00
One column, six months	220 00
Half column, six months	115 00
One column, three months (13 weeks)	110 00
Half column, three months	60 00
Per line (smallest type) one year	3 00
Per line (30 lines or more) one year	2 40
Per line, three months	1 00
Per line (10 lines or more) three months	80
Per line, one month (4 weeks)	50
Per line (10 lines or more) one month	40
Per line, one week	25
Per line (10 lines or more) one week	15

Mining Notices, Legal Advertisements, Special Notices, etc., inserted at especially favorable rates.

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form; we will otherwise assist advertisers in getting up their notices, when desired.

☞ All advertisements inserted in the PRESS are contained ☞ in the MONTHLY SERIES of the MINING AND SCIENTIFIC ☞ PRESS, which (by special arrangement) are placed for ☞ FREE READING in the principal hotels, steamboat and ☞ steamship saloons, depots, and public libraries in San ☞ Francisco, and the Pacific States. Many volumes are ☞ also bound, thus affording permanent advertising.

The PRESS now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers*. Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world. DEWEY & CO.,

Publishers and Patent Agents.

San Francisco, July 1, 1868.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

City Stocks.

Transactions in miscellaneous stocks have been limited during the present week, and for months past this class of securities has exhibited little animation. We note small sales of San Francisco Gas Company stock at $78. This company disbursed its usual monthly dividend of ½ per cent. on the 1st inst. California Steam Navigation Company realized 69¾@70¼ ₱ cent.; Spring Valley Water Works, $58@67 50. One share of State Telegraph Company stock was sold at $25. On the 1st inst., the Pacific Bank paid its usual monthly dividend of 1 per cent. on the amount paid in, the sum disbursed to the stockholders aggregating nearly $6,500. The Spring Valley Water Company pay their usual dividend nf ½ per cent. on the 10th inst., and the Merchants' Mutual Marine Insurance Company 1 per cent. on the same day. The San Francisco Savings Union have announced their dividend for the six months just closed, viz: 9½ per cent. per annum on ordinary deposits, and 11 2-5 per cent. on term deposits (free of Federal tax), payable on and after the 10th inst.

Mining Share Market.

The mining share market exhibits some improvement the present week, and generally most shares have acquired a more healthy tone as compared with last week's report. This condition of the market carries with it a much better feeling on the part of dealers, and after the national holiday season—the Board adjourning from this afternoon until Wednesday, the 8th—we may look for a briskor and improved market.

The work of mining development has since the opening of spring been steadily progressive throughout all parts of the Washoe country, new additions being constantly made to the list of productive and profit-paying mines. While no new paying claims have been opened, or deposits of importance lately made on the main Comstock lode, most of the claims situate on that range are yielding their accustomed complement of millable ore, while a number of lodges in the vicinity, but situate a considerable distance from the mother lode, have been worked with results that, having already proved remanorative, promiso to be permanent. That the usual quantity of ore of a workable grade is being raised from the Comstock group, is evident from the fact that all the mills dependent on this source for their ore supplies have been kept steadily employed and at about the same rates as formerly. From the more interior mining centres of the State, such as Reese River, Humboldt, Silver Peak, Pine Grove, Cortez, Silver Bend, and the districts lying further east, the reports are favorable for a good summer's work, and there is no doubt but the yearly hullion product of Nevada will be larger this than it was last year. The State abounds with mines rich in both gold nnd silver, but owing to its remoteness and other disadvantages, much time and money are required to thoroughly open them and erect works for the reduction of their ores.

In Idaho a season of considerable activity is looked for, work having been resumed and pushed ahead during the past few months with unusual energy both in the quartz and placer mines. Several new ditches are to be built this season, some of the smaller being already nearly finished, for conducting water to the various diggings in the Boise Basin, while a number of quartz mills will be put up in the Flint, Rocky Bar, Alturas, and other leading districts, all of which are known to contain many valuable metalliferous lodes, and in some of which very important discoveries have recently been made.

From our carefully compiled record of the sales in the San Francisco Stock and Exchange Board, we give the following interesting figures, for the first six months in 1865, 1866, 1867 and 1868:

MONTH.	1865.	1866.	1867.	1868.
January....	$1,901,598	$2,727,187	$3,664,322	$8,698,934
February...	2,358,853	3,752,292	3,303,520	9,716,596
March.....	5,528,900	5,299,084	4,034,289	11,471,430
April.....	4,329,022	4,038,086	5,833,016	12,395,304
May.....	5,965,549	3,052,102	7,851,855	10,162,396
June.....	4,711,640	2,406,341	6,864,365	9,078,063
Totals.....	$24,565,574	$21,275,102	$31,113,367	$61,513,123

The combined sales during the six months just closed are nearly double those of same period in 1867. The transactions at the open sessions are included in the above statement, and amounted to $1,634,625 in January, $2,138,763 in February, $2,676,558 in March, $2,753,474 in April, $2,112,940 in May, and $2,132,086 in June, making a total of $13,468,283 for the past six months.

IMPERIAL—was dealt in to a moderate extent, advancing from $130 to $141, receded to $135, then sold at $137, and closed at $140. Have reached nothing satisfactory as yet in the drifts from the lower level. We glean the following from the report of the President, submitted at the annual meeting, held on the 30th of June: For the current year just closed there were crushed at the Gold Hill Mill for the Alta Mine, 2,129 tons, yielding an average of $20 29 per ton; and from the Holmes Mine 8,764¼ tons, yielding an average of $20 11 per ton; in all $219,420 99. There has been crushed at the Rock Point Mill, from the Alta Mine, 30,341 tons of rock, paying an average of $22 22, amounting to $674,-133 28. The cost of hauling and working ores at the Gold Hill Mill has been $9 80 per ton, including supplies on hand, amounting to $7,789 05. The cost of hauling and reduction at the Rock Point Mill has been $9 55 per ton, including supplies on hand, $11,433 12. Cost of mining 31,491 tons from the Alta Mine, $156,286 96, or $4 96 per single ton, which includes running drifts and general repairs of hoisting works and timbering. From the Holmes Mine, 8,851 tons have cost $41,998 53, or $4 74½ per ton. Dividends have been declared and paid to the amonnt of $120,000, or $30 per share. In sinking the Imperial-Empire shaft and erecting hoisting works, there has been exponded during the last year $94,506 85, and the same is in the most complete working order. The repairs to the Rock Point mill dam have cost $21,486 74, and improvements at the Rock Point Mill, consisting of dwelling house, machine shop, and new boilers, etc., have cost $7,331 02. All debts and liabilities of the Company are paid to the close of the month of May, 1868, and no liabilities have been carried over to the month of Juno. The Superintendent reports that, estimating from the best measurements that can be obtained of the different bodies of ore now developed on the 371 and 230-feet levels of the Alta mine, there yet remains to be extracted 8,700 tons, which ore will mill from $16 to $30 per ton. In addition to the above amount of ore, we have some 1,800 tons on hand, in the dump at the mine; making a total of 10,500 tons yet to be milled. A summary of labor done in and about this mine during the past year shows the running of 320 lineal feet of drifts, 40 feet only of which was run in ore; the sinking of 120 feet of winzes, the extracting of 31,491 tons of ore, re-timbering throughout the different levels being worked in mine, repairs on shaft, and general repairs in and about the mine. Most of the ore being taken from the Holmes Mine at the present time is from small bodies found aronud old workings on the 210 and 290 feet levels. Both of these levels are still worked, producing all he ore being extracted from this mine, which ore is of low grade, ranging from $15 to $22 per ton. There yet remains to be extracted from this mine, from the 210 and 290-feet levels, about 2,000 tons of ore, sufficient to keep the Gold Hill Mill running for three months. The amount of work done in this mine during the past year has been the running of 180 feet of drifts, mining on the surface, and the extracting of 8,851 tons of ore. From the Secretary's elaborate statement for the fiscal year ending May 31, 1868, we obtain the following:

RECEIPTS.

Cash on hand May 31, 1867.....	$36,806 62
Bullion	893,554 27
Tailings, etc.....	3,553 75

From the date of incorporation of this Company, March, 1863, to the close of the present fiscal year, the receipts amounted to $1,625,069 33, of which $4,535,388 26 was for account of ores and snedries sold. The dividends disbursed aggregate $1,043,500, while only $50,000 has been collected in the shape of assessments. The available supplies on hand (May 31, 1868) were valued at $23,131 92. Subsequent to the reception of the reports shove alluded to, the following gentlemen were elected Trustees for the ensuing year: Wm. B. Bourn, John Sime, Wm. Carman, J. E. De la Montagnie, H. F. Cutter, and W. H. Sharp. This Board then chose the following officers: President, Wm. B. Bourn; Vice-President, J. E. De la Montagnie; Secretary, D. A. Jennings; Superintendent, J. D. Greentree.

SAVAGE—has been rather quiet during the period under review, selling within a range of $156 50@159 50, and at the close realizing $159. The ore product during the past four weeks has been as follows:

Week ending June 6—1,768 tons, valued at...$47 21 per ton.
Week ending June 13—1,730 tons, " ... 49 20 "
Week ending June 20—1,672 tons, " ... 44 29 "
Week ending June 27—1,611 tons, " ... 44 60 "

For the past three weeks the south mine, on the fourth station, yielded as follows: June 13th, 1,768; 20th, 1,063, and 27th, 1,134 tons of ore. In this locality of the mine the breasts continue to look well, the ore being quite abundant and of good quality. The south mine, on the fifth station, is also reported to continue in good ore, the face of the drift running in very rich ore for some ton feet, but at the close of report was not quite so good. The retimbering of shaft has been completed to the sixth station, but on account of the bad condition of the gronnd will have to sink some ten feet deeper before opening the station. The receipts of hullion to date for account of June aggregate $337,400, and it is thought will reach $360,000 for the month.

HALE & NORCROSS—has been exceedingly active since our last reference, rising to $102, declining to $90, and at the close selling at $91. In drifting south on the vein, they developed four feet of ore, and recent assays of the same show an average of over $47 per ton. The north drift is carried outside of the ledge, so as to avoid the flow of water, and they have not yet determined when they will cut into the vein.

CROWN POINT—receded from $94 to $91 50, rose to $99, and closed at $96 50. The hullion returns to date for June account foot up $85,735. On the 28th of June, the south drift on the 800 level was 173 feet from the line, showing two and a half feet of ore in the face. On the 1st inst., they had progressed 182 feet, and the face looked poorer, and on the 2d, the distance made was 186 feet, and stated to be looking better. The drift carries ore senth much further than was expected, and the indications are thought to ho very favorable as regards the 900 level. The shaft is down 108 feet from 800 level, and is soft rock; commenced to drift from 900 station, and at latest date work progressed favorably.

KENTUCK—was in moderate request, selling at $380@385 50, then at $372 50@390, and closing at $388. The receipts of hullion for June so far aggregate $69,963, and it is believed that, together with what the additional mill—put on a short time since—will produce, the yield for June will reach $95,000....GOLD HILL QUARTZ was in the market at $100@95. On a June 29th, received $3,178 69 in hullion, making $9,966 to date, and the aggregate for the month will he about $10,500.

GOULD & CURRY—is little inquired for, sales having been made at $105@114. The Bonner shaft is now about 976 feet in depth, and they are sinking at the rate of over a foot a day. This company has at present $70,000 in its treasury. They will have some revenne from the redaction of accumulated "slime," and from the ore extracted from the upper works, of which they have already over 300 tons on hand.

CHOLLAR-POTOSI—declined from $273 to $237 50, and closed at $240. At the 1,100 station, the water continues to increase as the drift goes forward—making slow progress on account of the large flow of water. No material change in the old works. The ore statement of June 29th shows that the shipments to custom mills on that day amonnted to 143¼ tons....OPHIR rose from $12 50 to $15, and closed at $16. On the 30th of June, the new shaft was timbered to a depth of 322 foot. The rock in which they are sinkiag is very hard; however, they have somewhat less water to contend with.

ALPHA—advanced from $48 50 to $52 50, and closed at $52. A new station will be opened about 230 feet from the surface. This is 90 feet above the 340 level, from which point a considerable amount of good ore has been extracted. The 340 and 440 levels are closed np from pressure of timbers, and hy running a level mid-way between them entirely new ground will he explored. The assessment of $25 per share, or $100 per foot, levied on the 29th of June hy the old Alpha Company corresponds with the one levied by the above company, and is upon stock not yet surrendered to the consolidated company, amounting to about seventy feet ....The UNITED STATES levied an assesment of $1 per share on the 29th of June.

THE MUSEUM OF NATURAL CURIOSITIES, to be seen at Woodward's Gardens, is worth the full price of admission, saying nothing of the animals, "Pictured Rocks," and other attractions.

THE SUTRO TUNNEL.—The telegraph this morning states that the *Tribune* Washington correspondent says the House Committee on Mines has unanimously reported in favor of allowing $150 per foot for the construction of the Sutro tunnel; but thinks the bill will not pass the House.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, July 3, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.		Per ton.
12 per cent. ore	$16 00	22 per cent. ore	$43 56
13 " "	18 62	23 " "	48 45
14 " "	20 20	24 " "	49 33
15 " "	23 85	25 " "	52 22
16 " "	26 20	26 " "	55 11
17 " "	29 12	27 " "	58 00
18 " "	29 91	28 " "	60 80
19 " "	34 90	29 " "	63 77
20 " "	37 78	30 " "	66 66
21 " "	40 67	31 " "	59 55

These prices, we believe, will he found substantially correct, and can be realized at this date.

THE TELEGRAPH SIGNAL ARRANGEMENT, adopted some few months since at the Savage mine, and which we have already described, is said to work admirably. The Gold Hill *News* says that insulated telegraph wires now pass from the surface down into all the principal stations of the mine, and by means of a very simple telegraph instrument at each reqnisite point, a bell is rnng at the surface, signaling the engineer the same as by the former method. The old style of bell wires was very troublesome, as by the constant pulling and tnging at it in signaling, it was liable to become disordered and often in need of repairing. The galvanic battery used is kept at the surface. To keep this battery running costs a mere trifle. This style of telegraphic signals might bo adopted to very good advaatage in all our principal mines.

Important to Californians.—Many inventors have ately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Oovernmentlicense and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Silver Mountain *Chronicle*, June 20th: In the immediate vicinity of this town, claims are being worked with energy, and the prospects of having rich paying mines in the Silver Mountain district were never so good as they are at this time. We hear rumors of contemplated mining operations in other portions of the county. Preparations are being made for commencing work on claims that have not been worked for years.

Amador County.

Jackson *Ledger*, June 27th: Everything in the vicinity of the Kennedy mine is hurry and bustle. They have a good portion of the timber and lumber on hand for the new mill, and the men are busy framing it. The mill will be located immediately below the grade, convenient to the mine, so that rock can be run in a car and placed in the dump at a very trifling expense. Their new shaft is going down rapidly.

Dispatch, June 27th: The new 20-stamp mill that is being erected at the Kennedy mine, near this place, by Fleming, Langford & Co., is progressing finely, and will be ready to commence crushing rock in about six weeks.

Calaveras County.

Chronicle, June 27th: One hundred tons of rock from the Shear ledge, near the May Pole House, are now being hauled to the Water Co's mill, in Chili Gulch, to be crushed. This claim is owned by parties in San Francisco, and should the rock pay as well as the prospects made have indicated, a mill will be erected at once.

Inyo County.

Los Angeles *News*, June 23d: Several teams arrived in this city from Owens River on last Friday, bringing down as freight 3,500 lbs. of silver and lead bars, which had been extracted by the furnace process from the mines of that locality. Mr. Westerville, just from Owens River, says that the miners have a good thing in the Cerro Gordo district, as the veins are large, the ore easily extracted, and the mines paying all the way down—some of them over 100 ft. deep. There are many mines in the Cerro Gordo district, mostly worked by Mexicans, who sell the ore to the furnaces, and who require but little capital to start with, but the principal mines are the San Ignacio, Belmont, San Louis and Union, owned by energetic companies, who are developing the mines and erecting furnaces with great activity. The Kearsarge mine, Camp Independence, is putting up furnaces. It is estimated that the lead contained in the metal will pay all expenses of getting out the ore, smelting, freight, separation, etc., leaving the silver as profit.

The Independence correspondent of the Aurora *Union* of June 20th, speaking of the Silver Sprout mill, says: It is a large furnace with a roasting floor 10x12 ft., and being 13x20 ft. from out to out, built in such a manner that the Colorado Terrace or the Stetefeldt furnaces can be attached with very little additional expense. With its present capacity about eight tons of ore can be oxidized in 24 hours. By all the experiments on the Kearsarge or Silver Sprout ores, oxidation is the only thing necessary to make them pay from $175 to $250 per ton, as all the lead is oxidized and floats off with the water, and all the chlorides can then be saved by precipitation.

The miners in the Alahama district averaged $12 per day to the hand last week, and are still "averaging."

Mariposa County.

Gazette, June 26th: Bogan & Co., of the Pedro Goza mine, on Bear Creek, struck a very rich lead a few days since.

The garden formerly known as Powell and Allison's, at Mormon Bar, has been sold to Chinamen for $460.

Nevada County.

Transcript, June 24th: The English Co. has made arrangements with Phelen and Mrs. Turney, who own the bed of Shady Creek, near the Oak Tree Ranch, to drift under the bed of the creek for the purpose of getting at the rich gravel deposits on the bed rock.

Martin Jauch is prospecting for quartz at Badger Hill. He has found some excellent croppings, and he is now running a tunnel to the center of the hill, for the purpose of striking the ledge. Some excellent specimen quartz, containing a large amount of free gold has been found in that vicinity.

The Badger Hill and Cherokee Gravel Mining Co. have been busily engaged since they purchased the gravel claims at Badger Hill, in building their flumes and preparing for work. This company expect to run a bed-rock tunnel from Badger Hill to Cherokee Flat, opening it to the bottom. In a short time they will employ quite a force in washing off the surface.

The English Co. are at work washing off a good deal of ground and obtaining excellent pay. They have discharged some heavy blasts of from 200 to 300 kegs of powder this spring.

Driscoll & Co., whose claims have been idle for several years, are now cleaning out their tunnel and will commence washing next week in the same hill.

McCarty & Hunter are working their claim between Columbia Hill and Cherokee with first-rate prospects. The Ditch Co. are working the Lewis diggings in the same locality. More mining is being done in this vicinity than for many years before, and the miners are greatly encouraged by their prospects.

E. D. Dean has claimed the waters of Bloody Run, to be taken out by a ditch below the old Bloody Run ditch. He also located 200 feet from the old ditch, down the creek, for a dam and for mining purposes.

June 25th: The miners in the vicinity of Moore's Flat are washing away at a lively rate with excellent prospects. The companies will clean up about the middle of July. The Boston Co. at Woolsey's, made a clean up, after a run upon pipe clay, on last Saturday, and got $2,900. At Moore's Flat a company made a partial clean-up last week, taking out $2,200.

June 27th: We were shown a specimen yesterday from the Selena ledge, which was literally filled with flakes of pure gold.

Perrin & Co., at Forest Springs, is now and have been for the past eight months, taking out $45 rock. An incline has been sunk about 125 feet, and the company is now running for the fourth level. The ledge lies very flat and is easily worked—averaging in thickness about three feet.

Palmer & Everingham are putting up a 5-stamp custom mill on the South Fork of the South Yuba River, near Eureka. There is a large amount of prospecting in this locality and no custom mill.

At the depth of 30 feet on the Phœnix ledge, eight loads of rock have been taken out and crushed, paying $73.

Poquillau & Clark have started up their new 10-stamp quartz mill at Eureka. It is estimated that 300 tons of rock can be obtained in the vicinity.

Another mill, to be run by water power, is being built on Poor Man's Creek, by Richmond.

Grass Valley *National*, June 25th: The Shamrock ledge, owned by Harrigan, Tierney & Co., have had several very good crushings—the last one averaging about $25 per ton. Rock is now being taken out which the owners are confident will run as high as $30 per ton.

In the lower tunnel of the Gen. Grant Co., which is 60 feet in length, 90 tons of rock were taken out about two weeks ago, and crushed at the Forest Springs mill, yielding $61 per ton. In the second tunnel very good ore has also been taken out, which paid about $46 per ton, while rock from the upper tunnel has paid on an average about $40—the last crushing consisting of 200 tons. A short time ago 275 feet in the Grant sold for $5 per foot.

Grass Valley *Union*, June 23d: The New York Hill Co. are taking rock from their shaft which shows richly in free gold.

Transcript, June 30th: The shaft of the Kentucky Blue Gravel Co. has been sunk 142 feet, and a bed of gravel struck, which has the appearance of being a river channel, and is supposed to cover a strata of pipe clay, and under the clay is the strata or channel of pay dirt, which it is expected will be reached after sinking 125 ft. deeper. So soon as the channel is struck by the Kentucky Co., a large amount of propecting will be done upon the channel.

Placer County.

Dutch Flat *Enquirer*, June 27th: The miners about Iowa Hill are reported to be taking out more money than for several seasons past. The great drawback now, as it always has been, is the want of water; with a good supply of water Iowa Hill would be one of the most flourishing mining camps in the country.

We learn that the claim of Mr. O. Harkness, situated in Cañon Creek, cleaned up a short time since, after a run of seventeen days and nights, $4,700. The claim employs ten men, five on a shift, and uses 550 inches of water.

Carr, Miner & Harriman, cleaned up, in their claim at Gold Run, after a run of ten days and nights, $2,365. The company use 315 inches of water and three pipes, and work three men on each shift, and have a pressure of 150 feet.

The Colfax correspondent of the Auburn *Herald* of June 27th, says: The Rising Sun Company continue to yield good returns at each clean up.

Plumas County.

Quincy *National*, June 20th: Mining matters at Rush Creek are prosperous. Several companies are at work, piping and ground sluicing, but none have cleaned up yet. Rush Creek is one of the oldest mining camps in the county, and has been very rich.

Sierra County.

Downieville *Messenger*, June 27th: The Wehe Co. have got their tunnel into the ledge, and find the rock as rich as it was above. The prospects are excellent for a paying mine.

The American Mining Co., at Morristown, having found the pipe clay in their diggings too expensive to work by the hydraulic process, have set in drifting with several gangs of men, and are confident of making it pay much greater dividends. They will pipe no more except near the brow.

Vast excavations are being made by the hydraulic miners, this season, at Eureka, Craig's Flat, La Porte and other diggings, where large streams are playing upon the banks. This has necessitated the removal of several buildings, and it seems probable that the profits of the season's work will be double that of ordinary seasons.

The Howland Flat correspondent writes: The mines seem to be in a very prosperous condition, and justify the hopes of paying better than for some time past. The coldness of the Spring has kept the snow from melting very rapidly, and the water season for sluicing in the hydraulic claims will be better than it has been for years. Already a large quantity of dirt has been run off, but as no clean-ups have been made, there are no figures. The tunnel claims are paying very well. The Monumental, at Potosi, is turning out about 175 ounces weekly. The French Co. is paying as well, in proportion to the hands employed. The Union, Down East and other Companies are generally making good returns.

Siskiyou County.

Yreka *Union*, June 20th: The Black Bear ledge on Salmon, keeps up its reputation as one of the best ledges in the northern part of the State.

There are but few miners on Soda Creek at present, but most who are there are doing pretty well. The only hydraulic company on the creek has taken out recently some pretty good chunks, one piece weighing $40, another $17.50 and another $10, besides several others of smaller size.

Tuolumne County.

Sonora *Democrat*, June 27th: A 40-ounce lump of gold was found yesterday in the Daley claim, Main Gulch, Columbia.

Arrangements have been made for the introduction of water into Chinese Camp.

The Stanislaus Gravel Co., having completed their mill, commenced work last Thursday. They have been engaged for the last two months in building the mill, running the main tunnel into the claim and breasting out gravel. The channel has been opened at three different points by branch tunnels, connecting with the main tunnel, showing a large bed of gravel which prospects well. They intend working 40 tons per day, ample provision having been made to take out more than that quantity.

Hanson & Boyer are making preparations to hydraulic the surface of a portion of Bald Mountain. The dirt is over 16 ft. deep and contains a little gold. The dirt appears likely to pay for working, but the main object is to lay the ledge bare and expose to view the numerous small quartz veins, that run in all directions over the mountain. In years past many very rich pockets have been found at that portion of the mountain.

The same gentlemen are also going to work another hydraulic claim, in the vicinity of Sonora and Bald Mountain, where the dirt is over 30 ft. deep and pays small wages for ground sluicing.

Yuba County.

The Brown's Valley correspondent writes to the Marysville *Appeal* of June 26th, as follows: The Jefferson claim seems to be improving every day. They are crushing good quartz and are out of debt. The Pennsylvania men talk of starting all their stamps again next week, and running them on good quartz. The Rattlesnake continues to crush rich quartz. They have to pan a sufficient supply for their 10 stamps in day time, but they have reason to hope that within a few days they will be running day and night, and on richer quartz than ever before crushed in this valley.

The *Appeal* of the same date says: We were shown yesterday a telegram to W. H. Knight, from Brown's Valley, stating that the Pennsylvania Co. had struck very rich quartz in level No. 10, incline No. 1.

June 30th: The Brown's Valley correspondent writes under date of June 29th to the Marysville *Appeal* as follows: The Rattlesnake Co. cleaned up last week $1,400, and the Pennsylvania $1,700. The Pennsylvania is now setting more men to work in order to get a more regular supply of quartz for their mill from different places. They have finally reached again, in level 10, their former rich pay chimney, which, with other resources, will carry them over all their present difficulties.

Mr. Gaskin of this city, has recently erected a 4-stamp quartz mill at Scabby Hill, on the old Jackson ledge, about two miles southeast of Brown's Valley, near Long Bar. The mill is run by water power, and we are informed that it is crushing very good rock.

COLORADO.

Georgetown *Miner*, June 11th: Professor Dibbin is making active arrangements for working his mines in East Argentine district.

There is a project on foot to run a tunnel so as to strike the Flora McLain lode at a depth of 500 feet.

The shaft on the Ashley Franklin lode is now down 25 feet, and 18 inches of splendid galena, carrying a large per cent. of ruby silver is being worked out. Two men mined and raised three tons of this ore in a single day.

The Boom Ditch Co. have discovered some six or eight very promising lodes.

Central City *Herald*, June 10th: Mr. Herrick will furnish another button to-day. He has now plenty of good ore.

The Polar Star mill is kept constantly pounding away on ore from the Foote and Simmons lode, for Mr. Lindsley. The crevice matter continues to improve in quality as they continue to sink.

We saw some fine silver ore from the Do Profundus lode, Monntain House district, this morning. It was taken from a depth of about 40 feet, where the crevice is 6½ feet between walls, with a vein of pay ore 20 inches wide.

Moores and Myers are working the Canandagua lode, night and day. Of late, they have had a heavy cap-rock to sink through, but from present indications they are led to believe that they are about through it.

Barret & Co. have the water drawn out of their claims, on the Winnehago lode, and have put on a strong force of hands, who are sinking their main shaft to a greater depth.

A friend who has been visiting Idaho, informs us that Lowe & Co. are working on Illinois Bar, and have a shaft down 18 feet, and expect to strike the bed rock shortly. Also that Skinner & Co., who are working on the same bar, have their water wheel and pump in position, and have now reached a depth of ten feet. He represents Idaho, at this time, as being livelier than at any previous time since the palmy days of '62.

The cupel furnace of the Georgetown Silver Smelting Furnace was heated at two o'clock on the afternoon of June 7th, and 10 A. M. of the 8th a button of 105 pounds was ready for shipment.

We were shown on Saturday last the result of an assay made by Mr. J. Smith, from the U. S. Bank lode, selected ore. Character of ore—quartz mixed with black sulphide and small specks of ruby silver. Result—one ton—2,000 pounds, gold, a trace, silver, $3,948.10.

John Kendall has recently made the discovery of a lode, which prospects very rich. From a run of half a cord made last week, under stamps, the surface quartz yielded at the rate of $30, gold, per cord.

Miller & Co., who are working a claim on the Hunter or Bates lode, last week, had 2¼ cords of ore crushed, yielding 46 ozs. of gold, sold for $975.86, making the product at the rate of $390 currency per cord.

Denver *News*, June 17th: About 600 stamps are running in Gilpin County. Men say they never saw it so lively at Black Hawk before.

Mr. Clark, one of the owners of the Terrible lode, writes that we did his lode great injustice in saying that the highest run of its ore was $400 per ton. The last five tons run, showed a yield of $658 per ton, coin value in silver. One and one-fourth tons worked at Newark, N. J., returned $720 per ton. Ten tons now ready for smelting show an average assay of $754 per ton in coin.

The owners of the Ten-Forty silver lode, at Buckskin, have out about 100 tons of fine ore. N. Newlin, running one arastra on tailings from the Orphan Boy, took out $200 worth of gold in a week. Capt. Bates is getting some arastras ready to run. Two mills have been taken over into Granite from Buckskin, and are expected to be in operation by the first of July. In Granite they continue to find rich things.

Central City *Register*, June 11th: The

U. S. Bank lode, of Gold Hill is turning out some of the richest silver ore obtained in Colorado. Assays have been made all the way up to $3,948.10 per ton. A few days ago, the owners delivered a quantity to Prof. Hill, and after crushing and sampling, he reports it worth $340 per ton in coin. A run made by Teats gave $180 per ton.

DACOTAH.

Sweetwater Mines, June 13th: Tozer and Eddy have purchased a 6-stamp quartz mill of Jennings, Godbe, Lawrence and others, of Salt Lake, which will cost, when put up and in running order, from $12,000 to $15,000. They will have the mill and two arastras in operation within 30 days. The mill and arastras will be run by water power, and will be capable of working fifteen tons of ore per day. The mill was made at the Union Foundry, San Francisco, and although it has got but few stamps, is very perfect and complete in all its fittings. The stamps weigh 650 lbs. each. There is one Wheeler pan of the new style lately adapted to the use of gold quartz mills; also, one Belden settler, and a Hendy concentrator.

Rock Creek is paying from $8 to $12 per day to the hand, and yet the claims are hardly opened.

The James Dwyer ledge near Atlantic City, contains some of the richest rock we have seen for a long time.

There are six companies at work in Summit district. Water is scarce, not having enough this season to ground sluice, though they have a good head of 25 in. for sluice washing. From the results already obtained, it is certain that from $6 to $10 per day can be made.

IDAHO.

Owyhee *Avalanche*, June 20th: The survey of the great tunnel to be run through War Eagle Mountain is about completed. The entire length will be 8,067 feet, and its greatest depth from the surface 1,340 feet. Besides a host of others it will penetrate 15 well-defined and good paying ledges, among which are the Silver Cord, Poorman, War Eagle, Ida Elmore, Golden Chariot, and Ore Fino.

Blake & Bro's bullion assays for May, amounts to $229,558, of which $128,518 is silver, and the remainder gold. The entire amount of bullion assayed in camp for the two months ending May 31, is $378,688.23.

The Woodstock Co. are now down 40 ft. in their north shaft, below the tunnel level. At that depth the quartz is about three feet in width and looks richer than ever. Seventy-five tons of the ore are being hauled to the Upper Sinker mill.

Yesterday, steam hoisting works arrived for the Poorman and Golden Chariot mines. The Rising Star machinery has also arrived in Flint.

Two new discoveries have been made a short distance north of the Ore Fino. One of them is three ft. in width and the other four, at the surface.

The Flint correspondent writes: In the Rising Star mine work is progressing with uninterrupted vigor. Upwards of 200 tons of well-assorted rock is on the dump, which was taken out of the upper level where the ledge is still 20 ft. wide. The main shaft has been sunk to a depth of 120 ft., where a new level has been started south. At this depth the ledge has been penetrated to a width of about eight ft., showing an increased richness of ore and a remarkable purity of metal, in most of which ruby silver predominates.

Lewiston *Journal*, May 30th: At Pierce City the miners are in hopes of having a fair season's work. Water is yet plentiful, and the recent rains and snow in the mountains will aid the supply.

Same of June 6th: The Warren's correspondent writing under date of June 3d, says: I understand that the Hic Jacet mill is to be supplied with additional machinery and will soon be running. The Williams & Maxwell has been undergoing improvements and is ready to crush quartz as soon as it can be delivered at the mill. Considerable work has been done and much quartz taken out on the Winfield Scott, Wolverine and Knott ledges, but it has been impossible to get it to the mill. This difficulty is now obviated, as pack trains will transport it.

Work is soon to be commenced on the Washington, and specimens indicate it to be very rich in silver. This ledge is located very near the Williams & Maxwell mill. Several new ledges have lately been struck; one called the Loche & Long, another called Kloneas; still another struck by Tom. Rockland, very rich in gold—as yet nameless. This ledge is decomposed quartz, and from one pan of the ore one dollar of free gold was extracted.

Several arastras are in course of construction, one by Long Brothers and two by Bemis.

MONTANA.

Post, June 12th: The far north mines of Libby Creek, concerning which there was so much excitement last year, now contains about 100 men, who are working both in the creek and upon bars. Upon an average, they are doing no better, if as well, as in this portion of Montana.

We saw in the assay office of F. Bohm, on Saturday, one of the finest specimens of Montana gold that has ever existed in the country. It consisted of a gold brick weighing 136 ozs., and worth $2,750. It was noticeable on account of its great purity, the assay showing it to be .975 fine, or worth $20.25 to the ounce.

A French company, consisting of three persons, working in Norwegian Gulch, lately took out over $300, mostly in large nuggets, in one day;—$100 to the man is fair diggings.

About one week since Mr. Whitlach sold to Messrs. M. Upton and Ed. E. Walker, one-half of his 320 feet on the Discovery and adjoining claims on the Park lode.

Over 300 pounds of silver bullion, valued at over $7,000 in currency, arrived at the First National Bank last night. This was the result of 11 day's work by the St. Louis M. & M. Co'e mill, on about 70 tons of quartz from the Hope lode at Phillipsburg.

Darah, Harris & Co., at Jefferson Gulch, are doing still better upon their claim than previously reported. Their last clean up for an eight days' run with four men working during the day time and three during the night, yielded 71 ozs. of gold, or at the rate of nearly $23 per day to the man.

The quartz in the Last Chance is now three feet thick.

The Dead Beat Co. in Washington Gulch, are doing well. A party just above them is taking out from $7 to $10 per day to the hand.

One of the finest mill runs of the season, is a large and beautiful mass of retort at the assay office of Molitor Bros., which, when melted, resulted in a brick weighing 430.35 ozs., and worth $6,410.47. This lump was the result of the last run in the Union mill, during a period of six days with 12 stamps.

The Silver Bow correspondent writes: I am certainly within bounds in stating that over $30,000 per week is being taken out of the mines in our vicinity, and the amount could easily be doubled with water on grounds that our present ditches cannot command. A few days since one of the claims in the main gulch, just above Rocker City, presented its owner with a nugget of almost pure gold, weighing 21 ozs., 5 pwts.

NEVADA.

Esmeralda.

Aurora *Union*, June 20th: Gov. Blasdel has been spending several days in Aurora and vicinity, examining the mines. He has purchased the Homestake mill and mine at Bodie.

W. M. Boring, recently from Hot Springs, gives the following from that locality: The Dozier Metallurgical Co. will commence operations again with their smelting furnace in a short time. Messrs. Williams & Wickland will start their furnace again in about a week. They have discovered a ledge of almost pure feldspar, which stands fire better than any available substance yet discovered, not excepting English fire bricks. They have ascertained that this material, when taken from the ledge deep enough to get it perfectly solid, will stand the heat as long as they may wish to use it. Dozier & Co. are refitting their furnace with the same material.

Reese River.

Austin *Reveille*, June 11th: We received yesterday a box of specimens from the Mammoth district. The specimens were obtained from the ledges recently discovered in the western part of the district, about four miles from the town of Ellsworth. Some of the ores are largely gold-bearing, in others silver predominates, and in others again both of the metals occur in equal proportions. Decidedly the finest samples are from the Marble Falls ledge, and the first and second northwest extensions of that ledge. The assays of the ore, as specified on the labels, range from $300 to $3,000 per ton; and one sample of the soft, friable stuff, is marked as yielding by assay $6,000 in gold per ton. Two rich chimneys were recently opened to the depth of 10 ft. on the Marble Falls ledge, in which the white portion of the quartz was thickly studded with free gold; and some parts of the decomposed ore are said to be immensely rich. In a number of "horn tests" the yield of fine gold ranged from 25 cts. to $6; the former being the ordinary result of the ore taken from almost any place along the ledge for the distance of 600 ft., where the ore is characterized as decomposed iron pyritee.

June 16th: Yesterday a small lot of gold from the Goose Creek diggings, was brought into the city and deposited. It contained 37 ozs., worth $12.75 an oz., making the whole value $484.50. The gold was procured from a placer, but we did not learn the name of the claim.

June 22d: On Saturday evening 15 bars of bullion, averaging .700 fine, and valued at $15,410.27, were brought into the city from the mill of the Combination Co. and shipped to the office of the company in New York.

The bullion produced by the mill of the Combination Co. at Silver Bend, from the 20th of February to the 18th instant, amounted to upwards of $161,000.

We were shown to-day a certificate by Boalt & Stetefeldt of an assay of the pulp of one ton of ore from the Park ledge in the Reveille district, which gave a yield of $848.45 per ton. The ore was reduced at the Manhattan mill.

In White Pine district a Mr. Lindsey has sold 250 ft. in the Aurora claim on Treasure Hill for $2,500; and William McCauley has sold 200 ft. in the same claim and 245 ft. in an extension of the Hidden Treasure to parties in this city, consideration not given.

June 23d: We saw this afternoon at David Lundbom's assay office two small bars of bullion weighing 1,275 ozs., .970 fine, and valued at $1,601. They were the product of ore from the Hidden Treasure ledge.

Silver Bend *Reporter*, June 20th: The owners of the Silver Queen still push work upon that claim. A depth of 35 ft. has been reached upon the vertical shaft now sinking, which is evidently near the lode.

At the distance of 20 ft. in the new south level on the North El Dorado, a body of exceedingly rich sulphuret ore about two ft. thick has been encountered, several tons of which is now extracted daily.

In the south incline of the Arizona ledge at a depth of 50 ft. a stratum of rich ore about two ft. thick has been disclosed near the hanging wall. Quite a quantity of it has been brought to the surface, and it is said, will yield largely.

Good ore is coming from the Arizona and Vulcan mine on Arizona Hill.

June 24th: At Rattlesnake Cañon all is bustle and activity. Jo. Williams has a fine ledge in the edge of the valley, from which he is now taking excellent ore. The Wyoming, of Gillett & Clark, has been sunk upon for 50 ft. and is still as rich as ever. Col. Raymond is sinking a shaft upon the portion purchased of Gillett & Clark, with favorable prospects, and will erect a mill as soon as sufficient developments have been made. From all appearances Hot Creek will soon be the liveliest district in Nye county.

A day or two since, at Cahill Bros' assay office, we saw a beautiful bar of silver cast from crude bullion from Columbus district. Its value was $1,000, and it was produced from a ton and a half of ore worked in an arastra.

The 10-stamp mill at Hot Creek was started up on Monday, on ore from Morey district, a fine lot of which is on hand.

The Old Dominion mill, in Hot Creek Cañon is to be rebuilt immediately.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, June 25th: The Alpha Cons. Co. at Gold Hill, yesterday levied an assessment of $15 per share on its capital stock. The Savage Co. have removed two heavy boilers from their old works to their new ones, where they are being set up for use.

June 27th; The total shipment of bullion during the past week from this city and Gold Hill, was 11,962 pounds, worth $287,878.75.

Day before yesterday a cave of considerable extent occurred in that portion of the old works of the Savage mine, near B street, which is being worked by Patten & Co.

June 30th: An accident to the guides in the Imperial-Empire shaft last Friday afternoon, put a stop to bailing with the hoisting tanks for several hours, and the water rose over the track in the drift to the hight of four feet.

Gold Hill *News*, June 23d: The Cole, at Virginia, find their lead of rich ore, recently struck in their valuable mine, increasing in width as it is deeper developed. They are taking out 40 or 50 tons, in order to get it milled and test its true value. Judging from assays, it ought to yield over $300 to the ton.

There was shipped from Wells, Fargo & Co's Gold Hill office this morning, 14 sacks of bullion, weighing 1,053 pounds, and of the assayed value of $31,133.98.

June 26th: There was shipped from Wells, Fargo & Co's Gold Hill office this morning, 11 sacks of bullion, weighing 900 pounds, and of the assayed value of $23,362.95.

June 27th: There was shipped from Wells, Fargo & Co's Gold Hill office this morning, seven sacks of bullion, weighing 400 pounds, and of the assayed value of $11,692.36.

OREGON.

Jacksonville *Sentinel*, June 13th: Mr. H. Helms recently showed us a gold specimen from the Timber Gulch lead worth $19.50. The specimen is a peculiar looking piece, about two inches long and three-eighths of an inch thick. It has the appearance of being drawn out like wire and in that shape embedded in quartz. When it was found the quartz fell off from the gold and left it exposed in one solid piece.

Mr. L. Zeigler, in his claim on Jackson Creek, is taking rich pay from what has heretofore been considered bed-rock, obtaining therefrom as high as an ounce of gold from one pan of dirt.

The Eugene City *Guard* says: We have been shown specimens of silver-bearing quartz, taken from a ledge just discovered 40 miles from Eugene City. The specimens were taken from the outside of the ledge, and from an assay it was estimated that it would yield, at the lowest calculation, $500 per ton.

The Chinese Empire appears to be approaching a state of dissolution. The insurrection in the central provinces, which has been in progress for so long a time, is as vigorous as ever, while the principal movers therein do not appear to have any definite object or policy in view. Province after province seems to go into revolt; and recent rumors are to the effect that disturbances of a serious magnitude are taking place on the extreme western borders of the Empire. Russia and England are evidently making preparations to take advantage of whatever may happen. The former will be prepared, when the proper time comes, to increase her already overgrown possessions by slices from the northern and western portions of the Empire, with the view of ultimately securing the shore of the Sea of Japan. England already has a corps of engineers seeking for a railroad route across the southwestern portion of China, with the view of connecting the headwaters of the Bramahpootra and Yangtse Kiang rivers with a railroad, and thereby establishing direct overland steam communication between Calcutta and Shanghai. Such a route would shorten the distance between those two cities by more than one-half, or nearly 2,000 miles; and by avoiding the dangers of the China Sea, and the necessity for doubling the peninsula of Siam, would prove a powerful competition with our overland railroad for the European travel between Western Europe and China. Should such probabilities appear to approach an early and definite accomplishment, our own government should not stand by as an idle and unconcerned spectator. The true policy for the United States is to encourage a permanent native government, so divested of its exclusiveness as to admit of free commercial relations with all the world. It is to be hoped that the present commission, of which our distinguished countryman is at the head, may lead to such a result.

A Monster Cannon has recently been presented by the Sultan of Turkey to Queen Victoria. It has been placed in the Woolwich Arsenal. Several balls accompany it made of granite and weighing 650 pounds each. They are similar to those described in Gibbon's "Rise and Fall of the Roman Empire," as being used by Mahomet II. at the siege of Adrianople in 1453.

Blight.—There are indications that the pear crop in this vicinity will suffer severely from the blight. The early crop is nearly all more or less affected; it is hoped that the later varieties may measurably escape. We presume the *savans* of the Academy of Sciences will endeavor to seek out the cause for this evil, and, if possible, suggest a remedy.

San Francisco:
Saturday Morning, July 4, 1868.

Notices to Correspondents.

SULPHUR.—The employment of pyrites of iron for the production of sulphuric acid in place of sulphur, is not by any means a novelty on this coast, as you seem to infer from the remarks on the subject inserted in a San Francisco daily paper. Pyrites, for the purpose alluded to, have been employed, on pressing occasions, at the Mission Chemical Works, when sulphur could not readily be procured. The reason why the mineral pyrites ceased to be employed by the conductors of the establishment named, when the scarcity of sulphur passed away, we are not able to give; but if called upon, we have no doubt the proprietors of those works can give a satisfactory reason for returning to the use of sulphur, when that mineral could be procured with facility. We are informed that Mr. Reynolds, whose works are near Islais Creek, employed pyrites, and still does so, for the manufacture of sulphuric acid. We are told by the same informant, that Mr. R., on stating that he was about to visit Washoe with the object of erecting an acid manufactory, declared that it was his intention to employ pyrites for the purpose described by you. Whether this mineral or sulphur has been, or is still employed at Washoe for this purpose, we are not able to afford any information.

P. W., Stockton.—The most popular mode of illustrating the divisibility of matter, is usually exemplified by instancing the case of gold leaf. In the ordinary process of forming gold leaf, a single grain of it is hammered out until it covers a square space measuring seven inches on each side. Every square inch of such leaf can be cut into 100 strips, and each strip into 100 cross sections, each of which is distinctly visible to the unaided eye. A single grain of gold may in this way be subdivided into $49 \times 100 \times 100 = 490{,}000$ visible pieces. If such gold leaf, however, is attached to a piece of glass, 10,000 lines can be ruled in the space of a single inch, in which way a square inch of gold only weighing 1-49 grain, may be segregated 10,000 times 10,000, or into 100,000,000 pieces; or an entire grain into 4,900,000,000 fragments, each of which can be rendered visible by means of the microscope! Notwithstanding this enormous tenuity, we know that it is practically carried much farther, for the coating of gold employed for the purpose of forming gilt wire, is much thinner than that of the silver to which it is attached; as in drawing out the wire the gold coating continues to become thinner and thinner at each drawing.

TUBAL.—The fusibility of metals possesses a most extensive range, commencing with mercury at 39° below zero or 71° below the freezing point; potassium at 136°, sodium 190°, while cast iron, according to Daniell, does not melt until a temperature equal to 2,786° is obtained. Malleable iron and manganese require the most intense heat of a smith's forge in order to fuse them. This high temperature has been variously estimated,—but never accurately fixed,—at from 3,200° to 3,500°. The highest heat of a wind furnace is required to fuse soft nails into a button, from which datum Daniell estimated that the temperature could not be below 3,300° Fah.

NOTE.—In our reference, last week, to the potash and soda contained in albite and feldspar, the relative amount was transposed. Feldspar, instead of albite, contains an excess of potash.

J. F. C., Table Rock.—Your communication has been received and will appear, with comments, next week.

The Past and Present.

Before the days of steam and the advent of the printing press forced upon mankind the importance and necessity of a more general distribution of scientific and mechanical knowledge, the experience gained by any one individual was considered his own personal property, and was transmitted from father to son as an heir-loom in the family, until it was finally lost to the world, as was too often the case, by the sudden death of its only possessor. There were secrets in every trade and profession, gained, in the first instance, by hard-earned experience—the result of too many years of toil to allow them to be freely communicated to the world. There was no such thing as a patent office in those days, by which a man could secure for his personal advantage the first fruits of his ingenuity, so as to be afterwards content to allow the world at large to be benefited by his invention or discovery. Even the walks of science were hedged around with a wall which the vulgar tread was not allowed to pass.

But mystery in mechanics has had its day; the cabalistic formulæ of the chemist have been interpreted, and knowledge is now free and readily attainable by all. The patent office has become the great storehouse of the ingenuity of nations, so that nothing in the way of invention once known is lost. The magazine and the newspaper have become vehicles for the record and transmission of information, so that all who choose may read and learn.

The value of a journal, like the MINING AND SCIENTIFIC PRESS, to the mechanic, the lover of science, and to every one who would store his mind with useful and valuable information—gathered up from the four quarters of the earth—can scarcely be estimated. Upon its ample pages is spread, from week to week, a large amount of information carefully gathered and sifted out from the great mass of facts and ideas which are constantly being cast forth upon the great ocean of truth and knowledge. The labor of collecting this information and placing it before the reader in a condensed and classified form, is no small task. By this service the seeker after knowledge is saved much dreary labor in searching over cumbrous records for the little that is new or valuable to the general reader. To the scientific student, to the beginner in mechanics, to the seeker after wisdom in any of her hidden ways—a journal like this is of inestimable value. It is a labor-saving machine, indeed, by the aid of which the hands and brains of two or three persons are able to accomplish the work of thousands.

With the present issue we commence our seventeenth volume. Each one of the series has presented a passing record of whatever was new or of especial interest that may have transpired during its allotted period; and each reader must judge for himself whether or not he has been profited by its perusal; whether it has assisted him in his attempt at discovery; whether he has gained any hints which have been valuable in his especial calling; whether he has been aided in unraveling the hard knots, so often proposed in our special columns; whether he has been informed, from time to time, of what is being done in his specialty,—and thus been able to avoid wasting his time and energies on labors already consummated; or, in short, whether or not he has been enabled to utilize, to any extent, the brains and labors of others as spread before him in the columns of the PRESS.

The past has spoken for itself; each succeeding volume forms a link in the great chain of progress,—connecting the past with the present,—and records, for the benefit of each, the accumulated knowledge attained by all. What we have done in the past must be our guarantee for the future. We shall keep RIGHT ON in our labors, doing our best to make the PRESS a journal richly worth all that it costs.

We present, to-day, some new features in style, which we trust will please our readers. It is our aim to produce a comely, as well as a useful journal—one that shall be no less creditable to the "art preservative," than faithful as a record of all art. Our new head has been designed and engraved by one of the most skillful artists in the Union; and the paper we are now using is manufactured at the Pacific Mills, Winsdsor Locks, Conn., especially for us,—an establishment noted for the uniform superiority of its products. The paper we are now using is of a better quality than is used by any other newspaper establishment on the Pacific Coast. In conclusion, dear reader, we hope we shall be as welcome to you, as the task of serving you is to us; and that our labors will continue to satisfy your thirst for scientific and useful information. As we continue our voyage, we shall endeavor to make it pleasant and profitable to both you and us.

The Interior Press and the Exhibition.

The interior press, which has already been quite liberal in its notices and advocacy of the Exhibition, would do well to more especially urge upon the mechanics and others of the interior the advantages which would accrue to them, as a body, from a full exhibition of their own skill and ingenuity. It is the desire of the managers to make the exhibition one for all the people of the Pacific Coast, and not chiefly for those in San Francisco. Let our interior cotemporaries stir up their friends a little, and note particularly such articles as are intended for exhibition from their several localities, as an encouragement for others to go and do likewise.

In this connection, it may not be out of place to record the fact that the interior press has very generally forwarded their several journals to be placed on file in the reading room of the Institute. Some fifty papers from various sections of the State have quite recently been added to the files of the reading room; but we think there are others which would find it to their advantage to follow suit. This reading room is well attended, and both the publishers who contribute their journals and the readers here will be benefited by the arrangement. The library of the Institute is now being increased by the monthly addition of from 100 to 150 volumes.

Mechanics Fair—Rules and Regulations.

The following is the substance of a portion of the rules and regulations adopted by the managers for the approaching Industrial Exhibition:

The Pavilion will be opened for the reception of goods July 27th; the Exhibition will open August 8th. All persons presenting articles must have them registered by the receiving clerk at the Pavilion. The name of every article must be distinctly attached to it. Articles for sale must be labelled accordingly. Steam power will be furnished free. Perishable articles will be received and may be removed at any time. The managers are particularly desirous that articles entered for exhibition should be presented as soon as possible after July 27th. Responsible keepers and an efficient police will preserve everything safe, which may come in before the day of opening.

All goods intended for exhibition should be forwarded to the care of W. J. Stoddart, Industrial Fair Building, San Francisco.

BANK VAULTS AND SAFETY LOCKS.—Mr. Jonathan Kittredge, manufacturer of fireproof doors, wrought iron girders, bank vaults and Monitor safes, is the agent for the celebrated Isham Key Register Bank and Safe Lock. See his advertisement.

The Forthcoming Exhibition.

Work upon the Pavilion still progresses with most commendable celerity. Over $32,000 has already been obtained to the loan fund, and subscriptions are still coming in; so that there is no lack of funds for pushing on the work. No such substantial interest has ever before been manifested by our citizens in behalf of such an exhibition. We have already noted the rapidity with which applications are being made for space; should more space than is afforded by the present floor be called for, it can readily be provided by additions, so that there need be no holding back on the part of those desiring to exhibit. Still all who intend to exhibit would do well to notify the proper committee (elsewhere designated) at the earliest moment, in order to secure a favorable position.

There will be a great number of interesting novelties presented for exhibition. Mezzara, the artist, will exhibit some works of sculpture of rare merit. The display of oil paintings will be very superior. There is a general disposition among our local artists to exhibit. Jacob Zeck is building a piano of California laurel, which will be a superb thing, and set off to good advantage the beauty of that native wood.

There will be an interesting and suggestive display of California building stone, an interest which has been altogether quite too much neglected in this State. Garratt will make a fine display of his manufactures; among the novelties he will exhibit are several brass cannon of his own manufacture.

We understand that there is a machine now on its way to this coast for making wood paper-hangings, which it is expected will arrive in season for the Exhibition. Mr. F. G. Edwards, Clay street, near Kearny, will make an imposing and unique display. Several mammoth mirrors will be exhibited, from 8x13 to 10x13 feet in size. A novel and patented process for cleaning wool and woolen goods will be exhibited. A newly invented gas generating machine, will be exhibited, by which it is claimed that gas of a superior quality can be manufactured for half what that illuminating agent is now sold for in this city. We would refer the reader to another column for some important extracts from the rules and regulations which have been established for the Exhibition, which exhibitors will do well to consult.

THE CHINESE SEEKING AFTER KNOWLEDGE.—The Chinese government has employed Dr. J. McGowan, who visited this city some two years ago, to write a book on mining and metallurgy. A Mr. Martin has also been called upon to prepare a work on natural philosophy, and a Mr. Fryer to make translations of several scientific treatises. This act on the part of the Chinese government gives evidence that the pernicious error of supposing that learning and civilization has its chief seat in the Celestial Empire, is rapidly fading out, and giving place to more correct and enlightened views. The traditional prejudice and exclusiveness of China and Japan, is fast giving way to the inexorible logic of events.

WINE GROWERS AND THE EXHIBITION.—Circulars have been issued to the wine growers throughout the State by the Managers of the forthcoming Exhibition, calling their especial attention to the advantages which may be derived from a general display of the various qualities and kinds of wine made in this State. Any wine or grape grower who may not receive such a circular within a few days after this notice reaches them, will do well to write to H. D. Dunn, Corresponding Secretary of the Mechanics' Institute, for a circular, which will explain the design of the exhibition, the object sought for, and other particulars.

Diagrams of the Comstock Ledge.

Mr. R. H. Stretch, Esq., has just completed a most elaborate set of diagrams, showing the developments and workings which have thus far progressed on the Comstock Ledge, in Nevada. These diagrams will form a part of the report of the U. S. Geological Exploring Party, which, under Clarence King, is now making an exploration of the country along the line of the Pacific Railroad, this side of the Rocky Mountains. These diagrams will be published in the official report of this survey.

The series is made up as follows: Three sheets, on a scale of 100 feet to the inch, showing the general plan of all the workings on the Comstock Lode. No. 1 includes from Overman to Alpha; No. 2, from Bullion to Best & Belcher; No. 3 includes Sides to Ophir.

One sheet of horizontal sections on North Potosi tunnel level, 331 feet below the Gould & Curry croppings, and on a level of the second station of the Savage. This section shows distinctly the expansion and contraction of the vein, with the distribution of quartz, horses, ore, seams, etc.

Three sheets of longitudinal sections, showing the depth of workings, distribution of bonanzas, etc. These sheets include the same mines as are represented in the general plans.

Three sheets of cross sections—eight in Virginia and sixteen in Gold Hill—fourteen in all.

These drawings are most admirably and faithfully executed from actual surveys, and convey to the beholder, at a glance, a most perfect and distinct view of the underground workings, distributions of ore, etc., along the chief portion of this celebrated vein. The amount of dead work which is shown in these diagrams is really surprising, and fully accounts for the heavy and numerous assessments that have been called for upon most of the claims upon this lode. No continuous vein of pay ore is seen. All the ore is confined to bunches and chimneys, which comprise but a mere moiety of the entire mass of the lode. The publication and distribution of this report will be looked for with much interest. It will form one of the most important contributions to the general mining intelligence of that region, which has ever appeared.

ST. IGNATIUS COLLEGE.—The Ninth Annual Commencement exercises of this institution, located on Market street, in this city, took place on Thursday and Friday evenings of last week. The programme for Tursday evening was as follows:—Introduction, by John Hicks. "The Vatican," (oration) by George Harrison. "Right and Wrong," (essay) by John Malone. "Song of the Zouave," (English verse) by James Ryan. "The New Crusaders," (essay) by Robert Tobin. "Temporal Power of the Pope," by Henry Harrison. "Philosophical Systems," (lecture) by George Harrison. "Shall We Erect a Monument to Our Fallen on the Field of Mentana?" (debate) by John Hicks, Chairman, Ch. S. Skidmore, Jeremiah Sullivan, Dennis Driscoll, James Ryan, Wm Griffin, James H. Campbell. "Mentana," (English poem) by Jas. H. Campbell. "Oxygen and Hydrogen," (lecture) by George Harrison. The pupils acquitted themselves in a very creditable manner, and were listened to with marked attention.

On Thursday evening about fifteen hundred persons assembled to witness the closing exercises, which were opened by a dramatic performance, which was exceedingly well rendered. This was followed by the distribution of medals and premiums, and an oration by Mr. F. J. Leonard.

This College was first opened for the reception of students in October, 1858. The design of the institution is to give a thorough classical, mathamatical and philosophical education. There is also a special commercial course connected with it, for the benefit of those who wish to qualify, in a short space of time, for the ordinary avocations of life. The chemical laboratory and philosophical apparatus is of the first order. The degree of Master of Arts was conferred upon Francis J. Leonard on Friday evening.

A NEW MONTHLY.—We are in receipt of the first number of the *Overland Monthly*, a magazine to be published monthly by A. Roman & Co., of this city. The general appearance of the magazine is about the same as that of the *Atlantic Monthly*. The type used is the old style, and 104 pages of reading matter are contained in the number. The articles, as far as we have had time to examine them, are well written, and contain much valuable information. The names of the contributors are not given, it being the intention of the publishers that they shall remain incognito. We certainly hope that the *Monthly* will be a grand success, both in a pecuniary sense to its owners and in a valuable sense to its readers.

LET THEM COME.—There has been a large accession to our population during the week ending with Sunday last. The Oregonian brought about 500 from the Atlantic States and Europe; the steamship China and sailing ship Eliza brought 1,589 from Asiatic ports; the Oriflamme 106 from Oregon, and the Idaho 29 from the Sandwich Islands. Several other vessels brought small numbers each. The arrivals over departures must have reached fully 2,000 persons.

PUB. DOCS.—We have again the pleasure of acknowledging the receipt of the following public documents from our Representative in Congress, Hon. D. R. Ashley: Patent Office, Mechanical for 1866, 3 vols.; Report of the U. S. Revenue Commissioner for 1865-6; Report of the Commissioner of Internal Revenue for 1865-6-7, 3 vols.; Message and Documents, 1866-7; Land Office Report, 1866.

FROM ELLSWORTH, NEVADA.—A private letter from a correspondent in Ellsworth says: This town has taken a new and strong lease of life by reason of the extraordinary discoverics made recently in the Marble Falls ledge. The developments on this immense lode continue to be of the most astonishing character in both gold and silver.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Agents in Colorado.

CENTRAL CITY.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN.—John A. Lafferty, Postmaster, is our agent in this place.

PERSONAL.—Wanted, by friends in England, information of Andrew Jackson Van Winkle and Peter W. Van Winkle. Address this office. 1v17-3m

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Paint will not remove in five minutes. Whether a frightful Burn, a griping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.

G. H. MOORE, Inventor and Sole Proprietor, 642 Market street, S an Francisco, Cal. 21v16-3m

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16:16tf

Mechanics' Fair Daily Press.

Having received permission from the Mechanics' Institute, we shall print the

Third Volume of the Fair Daily Press,

in the Grand Pavilion, during the approaching Exhibition, which opens on the 8th day of August, 1868.

Our publication of the DAILY PRESS, in the Pavilion in 1864 and 1865, met with marked success, rendering ample satisfaction to its patrons and numerous visitors attending the Fairs. We are now confident that, with improved facilities, experience, and active efforts, the present volume will be made still more attractive and useful for the increased thousands who will visit the Exhibition, and receive, gratitously, each issue

Fresh from the Press.

New and interesting features will be adopted. Each number will contain a large amount of sprightly local matter, together with much permanently valuable reading.

A limited portion of the paper will be allotted to a choice class of advertising, furnishing a favorable opportunity such as is rarely met with. Following are our uniform

Rates of Advertising:

One column during the Fair	$260 00
One-half column during the Fair	130 00
Per line (space of small type) during Fair,	2 00
Per line, 10 lines or more, during Fair...	1 75
Per line, 30 lines or more, during Fair...	1 50
Per line for single insertion	25

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form; we will otherwise assist advertisers in getting up their notices, when desired.

Notices of the Press:

Following are a few of the many compliments paid the previous volumes of the DAILY FAIR PRESS:

THE SCIENTIFIC PRESS proprietors strike off and give away thousands of their little sheet, entitled THE MECHANICS' FAIR DAILY PRESS. There were great crowds all the evening about the telegraph and the presses, many of whom had their first sight at the practical working of these great motors of civilization.—*S. F. Evening Bulletin, Sept.* 7, 1864.

SCIENTIFIC PRESS.—A printing office has been established at the Mechanics' Fair, and Messrs. DEWEY & Co., the enterprising publishers of the MINING AND SCIENTIFIC PRESS, are issuing from it a handsome double-sheet daily, which is a credit to themselves, its editors, and to the Fair.—*S. F. Morning Call, Sept.* 8, 1864.

THE MECHANICS' FAIR DAILY PRESS is the title of a very neat quarto paper published at the Industrial Fair Pavilion, by DEWEY & Co., of the MINING AND SCIENTIFIC PRESS. It reflects great credit, as does the weekly, upon the enterprise and ability of the publishers. We want it regularly.—*Reese River Reveille.*

Parties who intend to advertise will do well to subscribe at once for the amount of space wanted.

DEWEY & CO.,

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure in dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, - - - - Potrero, San Francisco.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

GODDARD & CO.

San Francisco, May 1, 1868. 18v16tf

MINING COMPANIES, MANUFACTURERS, CONTRACTORS, and employers of all descriptions of labor, are requested to send their orders to the Exchange at once.

19v16-3m H. C. BENNETT, Secretary.

ACCIDENTS BY BLASTING — TAMPING.— How frequently do we hear of the painful fact that a poor man has lost his life by blasting! Why does this occur? I believe that, in nineteen cases out of twenty, it is through carelessness—from a want of consideration that they are dealing with gunpowder. Let the charge of powder be put into the hole, not all at once, but whilst it is being done, settle it down twice or thrice with the swabstick, and when all in, ram it well down with the same tool—not with the iron ramming-bar—and cover it tightly and firmly with a piece of dry clay. This done, at once dip the end of the swabstick in water, or better still, into the wet sludge that has been made in the process of boring, and with it free the sides of the hole from the dust of powder which must, of necessity, have adhered to them in pouring in the charge, and which, if not removed, will be likely, by a spark from the ramming-bar, in tamping, to convey fire to it. Well wipe out your hole with the wet swabstick. Having done this put in a large layer of fine, properly prepared tamping, and softly and carefully settle it down and "floor" it with the ramming-bar alone—using no hammer for the first layer. I say put in a large layer, because if the first layer be a small one, it will be the more liable to be forced down by the ramming-bar and disturb the powder. Settle down the first layer of tamping in this way, and then, with impunity, the hammer may be used—taking care, at the same time, to keep the ramming-bar free from the safety-fuse. Let these little matters be attended to, and no fear of explosion in tamping need be apprehended—all will be safe—life will not be sacrificed. As a matter of course, proper material for tamping should be selected. I have frequently known miners, when working on hard, fiery ground, to carry tamping from home daily to the mines with them—stone of a soft yielding nature, and well bruised before used—bruised, coarse potsherd is good. There seems to be an idea existing very generally that tamping requires to be driven with great force with the hammer, so much so that, as before said, the mallet is sometimes employed; but this, as has fatally been proved, is not necessary—nay, if the hole be judiciously placed, even the hammer, generally speaking, need scarcely be used. I say fatally proved, because it is well known that on the first layer of tamping being hammered down explosion has taken place, the burden of the hole has been removed, and the poor unfortunate miner has lost his life.—JOHN LEAN: *West Briton.*

FURNACE IMPROVEMENTS.—A series of experiments, says the London Quarterly *Journal of Science*, has recently been carried out in London, in proving the utility of a new form of furnace, invented by Mr. T. J. Lehigh. This furnace is applicable for puddling, steel-making or other purposes for which an intense heat is required, and is adapted for burning fine or refuse coal, "which is instantaneously converted into gas as it is fed in," (?) a perfect combustion and intense heat being obtained. The crop ends of steel rails, placed in the furnace were reduced to a perfectly fluid state in twenty-five minutes. Wrought iron was also readily melted. Neither the peculiar construction of the furnace, nor the manner of feeding the fuel, is given. The coal is probably used in a pulverized condition; "the instantaneous conversion of the coal into gas," is hardly presumable.

Professor P. Turner, a gentleman of much experience in such matters, according to the authority already quoted, has written very favorably of a modification in the blast-furnace recently introduced by a Prussian iron manager. In this invention the walls of the hearth are carried to the bottom on all sides, so that there is no opening in the front—no tymp and no dam. The scoria is discharged through a scoria-outlet about six inches below the twyers. The advantages claimed are that vacillatious of the slag on the hearth is prevented; as there is no forebearth, there is no repairs of it—which is considered equal to a saving of at least twenty days in each year; there are no interruptions, and the furnace does not cool; the number of charges can be greater, and the number of hands lessened, while the work is much easier for all employed.

IOWA, alone, of all the States, is out of debt. She does not owe a dollar. This happy condition of freedom from debt is due to the wise and economical administration which the people of Iowa have been able to give them. It is, indeed, an enviable situation, which other States groaning under debt and taxation may look at with an admiring eye.

SUGGESTIVE FACTS.—In Ross Browne's report for 1867, the gold production of California is estimated at $25,000,000—less than a fourth of which is credited to placer mining. The wheat crop of 1868 is roughly estimated at 25,000,000 of bushels, which at an average of $1.67 per hundred, would give $25,000,000—as much as the whole gold production of the preceding year. Twelve years ago our gold mines yielded about $40,000,000 a year; the wheat lands hardly anything. The mines are still declining, but the increase in wheat production is greater than the decline in gold. The mines and wheat fields together now yield $50,000,000 and over. There are not over 2,500,000 acres of land now under cultivation of all kinds, in the State; yet the total amount of land susceptible of cultivation is not less than 50,000,000 of acres! When the State shall have reached its greatest capability in agricultural industry, our wheat crop will probably aggregate 200,000,000 of bushels, worth in average years four times as much as the highest figures ever produced in any year from the gold mines. The most encouraging feature in the change of industry from mining to agriculture is, that what we realize from the latter nearly all remains in the State and goes toward the improvement of farms and the building up of cities, towns and manufactures, while the products of the mines were nearly all absorbed by foreign markets to make up the balance of trade against us.

BUERK'S
Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are required, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress street, Boston.

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore.

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES, .459 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolvers of 12 M, 9 M, and 7 M, bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery,

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16tm

THE LATEST IMPROVEMENT

In Dentistry.

PATENTED DECEMBER 3d, 1867, by DR. O. W. COOL. The right of San Francisco reserved for his own use. The nature of his improvement consists in lining the entire concave surface with fine gold; it makes the plate twice as strong and one-third thinner than the common vulcanite plates. This work has given satisfaction in every case. Please call at No. 14 Third street, near Market, and see specimens. All work warranted as fine as the specimens. Prices reasonable, 21v 6 3m

Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—If desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship NEW YORK, Capt. C. M. Fauntleroy, will be dispatched on FRIDAY, July 3d, at 12 o'clock, noon, from wharf, corner of First and Brannan streets, for YOKOHAMA, to connect with the GREAT REPUBLIC for HONGKONG, and COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

COTTON IN CALIFORNIA.—The cultivation of cotton in this State has been attended with such indifferent success, that the probability is but little further effort will be made to continue the business here. Our local supply will probably be eventually obtained from the Sandwich Islands. The island of Nuhau, of that group, is said to be peculiarly adapted to such cultivation, as experiments the past seasou have fully shown.

Of the immigrants now arriving from the East a much larger portion than usual are Americans, mostly from the Southern and Western States, most of whom are laborers. They readily find employmeut either at farming or lumbering. The Labor Exchange is making itself especially usefnl in their behalf.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. Now advertisements should be handed in as early as possible.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077

3v13f SAN FRANCISCO.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8v13-1y Stove Store, No. 125 Clay street, below Davis.

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Mission st., San Francisco.

Hunt's Patent Wind-Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump.

Pumping Machines and general Machinery kept constantly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

23v16 **E. O. HUNT, Proprietor.**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... **$600**

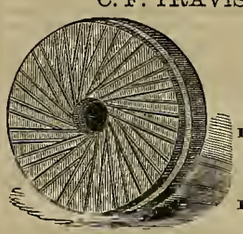
No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour..... **850**

No. 3—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour..... **1,200**

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.



BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

A SAFE, CERTAIN, AND Speedy Cure FOR NEURALGIA, AND ALL NERVOUS DISEASES.

Its Effects are Magical.

It is an UNFAILING REMEDY in all cases of Neuralgia Facialis, often effecting a perfect cure in less than twenty-four hours, from the use of no more than TWO OR THREE PILLS.

No other form of Neuralgia or Nervous Disease has failed to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and general nervous derangements,—of many years standing,—affecting the entire system, its use for a few days, or a few weeks at the utmost, always affords the most astonishing relief, and very rarely fails to produce a complete and permanent cure.

It contains no drugs or other materials in the slightest degree injurious, even to the most delicate system, and can ALWAYS be used with

PERFECT SAFETY.

It has long been in constant use by many our most

EMINENT PHYSICIANS,

who give it their unanimous and unqualified approval. Sent by mail on receipt of price, and postage.

	Price.	*Postage.*
One package	$1 00	6 cents.

Uncertainties in Quartz Mining.

There are certain elements of uncertainty in quartz mining not found in farming or manufacturing. The farmer, on looking at the soil, knows that it will produce grain enough to support him; he can ascertain precisely what it will cost him to transport his grain to a market, and so can calculate how much money he will receive from an ordinary crop. There is a possibility of a great drought or a great blight, but he has, perhaps, a little capital as a reliance in such a case, and he makes his estimates on the basis of an average season. If he cannot afford to risk anything, he does all his work with his own hands, and he cannot lose more than his time.

The manufacturer is uncertain about the price which he must pay for the raw material, but he knows the world will have the goods, and will pay as much to him as to anybody else, and if he can manufacture a little cheaper than others he is certain of his profit. If he is incompetent to manage the business successfully, some one else can afford to buy him out at the cost of the building and machinery and make it pay. When a manufacturing establishment is once erected by a person of judgment and experience, it is presumed that the business will go on steadily for generation after generation. The supply of the raw material and the demand for the manufactured article, at least if the goods are not of the sort required by fickle fashion, will remain constant.

But with gold mining it is different. Auriferous quartz lodes have paying quantities of metal only in spots or streaks. The law of the distribution of the precious metals in veins is yet unknown. The quartz may be traced for miles, but only here and there will it pay to work. No mineral lode anywhere is worked, I believe, with much profit for more than two continuous miles, and it is seldom that the pay-rock extends more than one thousand feet along a vein. The great quartz lode of Mariposa, called sometimes the mother vein of California, has been traced, it is supposed, for thirty miles or more; at least croppings of a large lead of the same quality of quartz, nearly in a straight line, are seen at various points between Bear valley, in Mariposa county, and Angels, in Calaveras county; and it is assumed that these croppings all belong to the same lode. In some places this vein is very rich, but the rich spots are not long, and are far apart, and in the intervals the rock is nearly or entirely barren. The miner may find quartz containing ten dollars to the ton, and he knows if the supply is abundant he may make a fortune from his claim; but to explore the lode requires a large capital, and there is no certainty of any return. The rock is too poor to work without a mill, and there is not enough in sight to justify the erection of a mill. If he takes the risk, and the pay-rock is soon exhausted, his mill, in that position, becomes worthless, and he loses the cost of all his frame-work, roads, and ditches, which, with the transportation, is frequently greater than the cost of the machinery proper. The manufacturer knows that his supply of cotton, wool, iron, leather, or wood, will not fail altogether, and if it becomes scanty he can raise his price so that his work will still be profitable; and the farmer knows that his soil will produce grass and grain as long as he lives; but the quartz miner does not know that the supply of his pay-rock will keep steady, and if it runs short he cannot expect the price of the precious metals to rise so that he can sell his produce for a higher price per pound.

There is, again, a great diversity in the facilities for quartz mining at different places. The farmer or the manufacturer usually goes into a level country with open roads, and after ascertaining the distance to the market and the cost of transportation, he can decide whether he can afford to go into business. Perhaps he would find fifty places within a range of ten miles, all equally good for his farm or his factory. But with the miner the case is different. The mines are usually found in the mountains, where there are no roads, water is not conveniently accessible, and wood is scarce. The rock in one part of the lode is hard, in another soft; in one there is much sulphuret of iron, in another little. It is relatively cheaper to work a wide streak of pay rock, other things being equal, than a narrow one. The mill may be far or near; it may be above the level of the mine, or below it; the water for washing the pulverized rock may be obtainable for only part of the year, and the gold may be found in thick masses so that the workmen can conveniently pilfer considerable quantities. Many of the mills are in secluded places, where men of wealth do not like to live, and thus the property is put in charge of

hired men, who lack the zeal and care of a proprietor. These are some of the points in which there are serious variations. It may safely be said that a farmer owning a hundred acres of rich soil on a prairie within twenty miles of any large town of Illinois, is certain of being able to make a very comfortable living; but a miner with a vein of auriferous quartz yielding ten dollars to the ton, within ten miles of a California town, is not certain of anything until he has examined the vein, its position, its size, the character of the veinstone and accompanying minerals, and the proximity and quantity of wood, besides a number of other particulars.

These are some of the diversities of circumstances which beset quartz mining in different places, and render it impossible to give a statement of the expenses of taking out rock, building a mill and reducing the ore, applicable to the majority of the mines. It is useless to attempt to convey any precise idea about matters in which the variations are so great between the workings of different mines, and between the workings of the same mine at different times. All that can be done is to collect the facts in regard to the operations of the mines and mills of which we have reports, so as to show the range.—*Ross Browne's First Report.*

SINGULAR FACT.—For mining purposes, says the *American Artisan*, gunpowder is now very commonly exploded by means of a wire rendered incandescent by electricity. It appears, however, that certain conditions are required to insure success. In vacuo the incandescent wire merely evaporates the sulphur, but the presence of air in ever so small a quantity, of nitrogen, or perhaps of any gas, prevents this, and thus renders the explosion certain. The evaporation of the sulphur is supposed by some to carry off the heat which would be required for the ignition of the other ingredients.

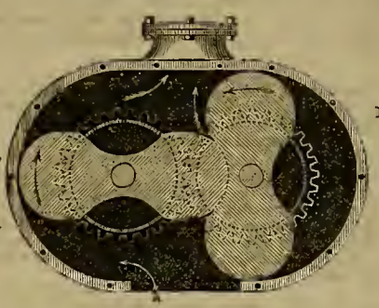
Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

1.—**Assaying of Ores,** Metals, and other Mineral Substances.

2.—**Metallurgy** of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixiviation, etc.

3.—**Gold Extraction,** by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.

4.—**Concentration.**—Dressing of Ores.

5.—**Construction of Furnaces,** in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.

6.—**Technology,** or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from **$50 to $200.**

Ores of every description assayed and worked

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

Subscribe for the New Volnme of the Mining and Scientific Press.

The proprietors of this jouraal will undertake to make the Seventeenth Volume of the MINING AND SCIENTIFIC PRESS (commencing July 1st, 1868), superior in maay respects to former issues.

It will be printed on extra quality of paper, rendering it a handsome volume to file for future use.

An increased amount of editorial labor will be expeaded in the preparation of leading articles relating to the progress of scientific developments in various parts of the world; aew discoveries in geology, mineralogy, metallurgy, and new processes and methods relating to mining in all its branches.

Illustratioas will be given of apparatus for saving precious methods, and of machiaery and inventions of general interest.

Eacb aumber will treat carefully on subjects of home trades, maaufactures and domestic economy

Our miniag summary and weekly stock report gives the latest aews from tho most important miaes and mining districts tbroughout the Pacific States and Territories.

An official list of patent claims issued to iaventors on the Pacific Coast, is publisbed in advance of all otber journals.

The latest priees of stocks are qnoted; also the produce and market rates, metal market and prices of copper ores.

Our "Mining Shareholders' Directory" advises holders of meetings, assessments, dividends, sales, etc.

"Answers to Correspondents" nfford much of iaterest to readers and of ndvantage to the commnnity.

The Mechanical and Scientific Miscellany contained on a single page of each issue we are frequently told is worth tho price of the whole paper.

Iaformation contained in one article has been known to benefit a single snbscriber nn hundred fold the cost of a year's subscription.

The PRESS was established in 1860, and as a mining and mechanical journal has met with unrivalled success.

Sample copies sent free on npplication.

Subscription, $5 per annum.

DEWEY & CO.,
Publishers, Patent Agents and Job Printers, corner Sansome and Clay streets, San Francisco.

MINERAL FORMATIONS.—There are old drifts in English mines where, it is said, quartz crystals have been known to form two inches in length within the space of a few years. It is stated that in the Great Devon Consols, thousands of crystals are constantly being produced. In certain localities in the Pertyreglase lead mine, in Coruwall, bunches of white carbonate of lead, two inches in length, have been formed in five years; spathose iron has also been formed in a very short time, on wood floating in the water of an unworked mine. A friend of ours in Nevada County, in this State, a year or two since, observed crystals of quartz springing out from the walls of an old drill-hole in slate rock, near the city of Nevada. He had a portion of the rock in which this curious phenomena was observed carefully cut out, which he now exhibits in his cabinet. The formation of copper and silver in disused mines has been frequently observed, and recorded. Most likely both the formation and decomposition of ores is constantly going on, to a greater or less extent in all mines. The universal law of nature seems to be that no form shall be permanent. Never-ceasing destruction and re-construction are characteristic, everywhere within the verge of man's observation, of both organic life and inorganic matter.

A DRIVING BUSINESS.—We understand that not less than 1,000 shirts, saying nothing of the conntless numbers of garments for ladies' and children's wear, have been made up at the Women's Coöperative Union Store, 39 Second street, in this city, since their organization three months ago. *

QUICK TRIP.—A gentleman arrived in San Francisco on Tuesday night last in less than thirteen days from New York.

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

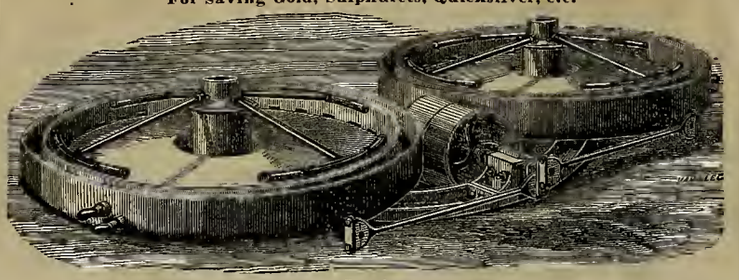

FIG. 1.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

Fig. 1 is a perspective view of that pan as now constructed. For economy of space and machinery, one shaft is made to drive two pans, which are set and arranged as shown in the engraving.

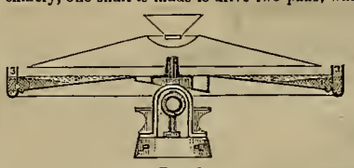

FIG. 2.

Fig 2 is a section through the center of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

RECOMMENDATIONS:

OFFICE OF THE ONEIDA MINING COMPANY,
JACKSON, May 13, 1868.

Mr. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard, last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save snlphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any other I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible.

Very truly yours,
JAMES MORGAN.

NEWCASTLE, Cal., June 21, 1868.

M. HUNGERFORD, ESQ.—*Dear Sir:*—Having used eight of your improved Concentrators (built by Goss & Lambard, of Sacramento), it affords me pleasure to bear testimony to their efficiency and adaptation to the purposes for which they are designed. I have used various styles of Concentrators during the last five years, but have found nothing that begins to compare with your machine, for durability and thorough concentration; and I can confidently recommend them to millmen, being, in my opinion, the best Concentrator now in use. Yours truly,
J. C. COREY.

BIG OAK FLAT, May 23, 1868.—*Mr. Thos. Mulford*—Dear Sir:—I have used two of Mr. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do.
E. M. SMITH, Supt.

These Pans can be seen at the Pioneer Mills, entrance on Stephenson street, San Francisco.

In future these Pans will be manufactured exclusively by GOSS & LAMBARD, of Sacramento, which is a guarantee that they will be built in the most substantial manner. Price, $300.

Address, Goss & Lambard, Sacramento, or M. HUNGERFORD, San Francisco.

AMERICAN

(WALTHAM)

WATCHES,

THE BEST!

THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a

MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer, another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale, under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are salable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted,

For sale by all first class dealers in the United States and British Provinces.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

San Francisco Weekly Stock Circular.
New Incorporations—List of Officers.

MISREPRESENTATION. — Somebody, who signs himself "S. R.," has been writing to the *Missouri Republican*, from Tahee, Cal., a long story about the sufferings of newly arrived emigrants in this city. He says that on the arrival of a ship at this port the wharves are usually lined with "an average of eight or nine thousand miserable looking men, each of whom rues the day when he first listened to the stories told about this land of gold." Out of this number, he says at least 5,000 have had no bed the previous night, and no "square meal" during the day. This is about the sum and substance of this lugubrious letter, which, it is needless to say, is a tissue of the most willful misrepresentations and falsehoods, from beginning to end. It is singular that our Eastern cotemporaries are so ready to allow such anonymous correspondents to so abuse their confidence. The only reply needed to such a statement, is the fact that we have in this city a free Labor Exchange, which is widely advertised, and on application to which any person who desires can obtain employment, and if necessary, transportation *free* to the place of employment. Hundreds avail themselves of this agency for obtaining work, every week; and it is usually the case that the demand for ordinary labor exceeds the supply, and at prices which are fairly remunerative.

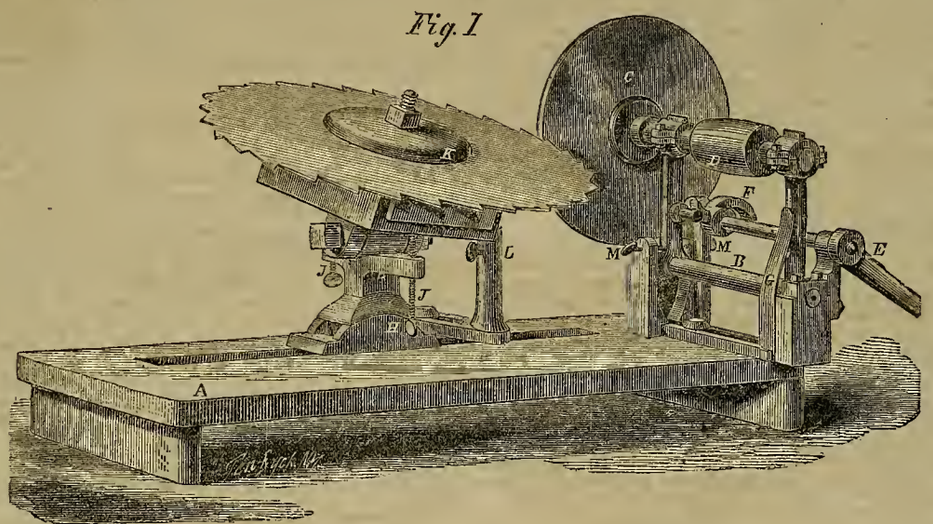
Since the above was in type we have noticed that the Pacific Railroad Company advertises for 300 hands for laying track—such as spikers, iron-layers, tie-layers, etc.—(work which any able-bodied person can perform) at wages varying from $45 to $65 per month in gold and board.

Furthermore, we may observe that the Secretary of the Labor Exchange has made his monthly report for June, in which he says it is scarcely possible to over estimate the demand for female labor on this coast. Ineffectual offers have been made as high as $30 per month in gold, for persons to do plain cooking, washing and ironing; and this when the same class of labor can be had in New York for from $8 to $12 in currency. We may also add the fact that there is not a man in the almshouse of this city, (nor need there be) able to perform any kind of labor. These facts afford an ample refutation of the above misrepresentations.

Improvement in Gumming and Sharpening Saws.

One of the difficulties, says the *Scientific American*, experienced by practical sawyers in the use of their saws, is the trouble of keeping them in working order. A large portion—toe large—of their time is expended in filing, gumming, or adjusting their saws. A handy, cheap, and portable contrivance for this purpose is certainly a desideratum. The one shown in the engravings contains all these requisites. It may be temporarily affixed to any bench, moved from one place to another, and is adapted to all sizes and styles of saws. The saw, whether circular or straight, can be presented to the gumming wheel at any angle.

Fig. 1



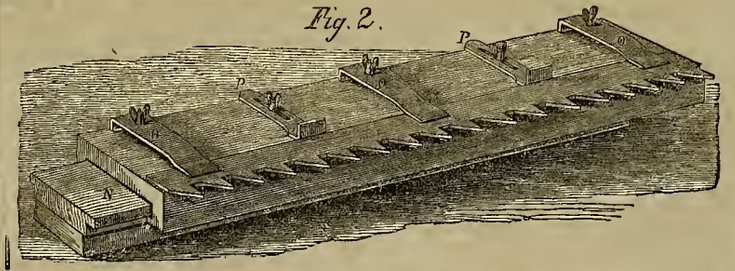


Fig. 2.

MARKLAND'S PATENT ADJUSTABLE SAW GUMMER.

Fig. 1 is a perspective view of the machine in position for operation; Fig. 2 shows the method of securing a straight saw to its bed in readiness to be operated upon by the emery wheel. Let A represent a table, or a section of a work bench, with a slot for receiving the standard of the saw support. The standard which holds the gummer or emery wheel and its appliances has a slotted bottom, through which and the bench passes one or more bolts by which it is held in position, the slot allowing for lateral adjustment. The uprights, which have the journal boxes on their upper end, are secured to shaft, B, allowing a swinging or rocking movement to the gummer, C, and its shaft, which is driven by a belt on the pulley, D. The gummer is advanced to the work by the lever, E, on the shaft of which is a cam, F, working against a stud on the inner side of one of the uprights. A spring, G, returns the gummer to place, when the lever, E, is withdrawn.

The foot of the saw support is pivoted or hinged to the base, H, both being held firmly to the bench by a bolt passing through the slot. This allows the saw to be set at an angle to the gummer. The saw is canted in the transverse direction by a joint and bolt, which permits teeth of any angle of edge to be adjusted to the gummer. Two screws, J, hold the bed of the saw in the position desired. The bed itself is dovetailed, and a corresponding sliding block fits the recess, and is held by a set screw. The bolt, which, with the flanges, K, hold the saw to the block, is small enough to fit the smallest eye, and larger eyes are fitted by means of properly sized thimbles. The stand, L, supports an adjustable rest to steady the edge of the saw on which the gummer is at work. The amount of forward and backward movement of the gummer frame is governed by thumb screws. Fig. 2, is a sliding rest for holding straight saws, its lower portion, N, being formed to fit the same bed as that which the block for holding the circular saw fits. The saw is held by the clamps, O, and adjusted to place by the stops, P. Small fans may be attached to the flanges which secure the gummer to the shaft, one on each side, to keep the teeth of the saw cool while being operated upon. A pan of ice on the bench under the gummer will serve to cool the air before it is taken up by the fans.

The operation of the machine may be readily understood from the foregoing detailed description and the engravings. It was patented April 2, 1867, by Thomas T. Markland, Jr. The machines will be furnished on application to Joshua Hendy, San Francisco; E. D. Eyre & Co., 248 South Eighth street, Philadelphia, Pa., or W. H. Miles, 117 John street, New York. We understand a sample machine will be shown at the Pavilion during the Fair of the Mechanics' Institute in this city, where practical men can see and judge its merits.

UNUSUAL ELECTRIC DISPLAY. The vicinity of this city was visited by a most unusual display of electricity on Monday last. About 8 A. M., a dark thunder cloud came in from the west, near the "Golden Gate," passed to the northward of the city, and apparently directly over the huge proportions of Mount Tamalpais. During its passage, sharp and loud peals of thunder were heard in rapid succession, reminding one vividly of a tempest in the New England States. Another similar phenomenon occurred a few hours later. The atmosphere, or rather the floating masses of vapor in the atmosphere of this region, appeared to be unusually charged with vapor during all the morning; so much so that for the first time since the telegraph has been in operation, in connection with this city, all business was suspended for the period of two hours by the flashes of lightning which played along the wires during the storm at midday. Electrical flames danced around the instruments in the San Francisco office, and it is said there were frequent reports like pistol discharges. As a matter of safety the instruments were disconnected, else they would probably have been melted, as is occasionally the case where lightning storms are frequent. The brass of these instruments in other localities has been melted into globes nearly the size of a bullet, and thick copper wire has melted away like lead.

Between the Warm Springs, Alameda County, and San José, four telegraph poles were shattered by the lightning—something entirely unprecedented in this part of the country. One of the instruments in the office at San José was injured by the lightning so as to render it unserviceable until repaired. More thunder was heard in this city, within two hours, than has been previously heard altogether for the last ten years.

There was but a mere sprinkle of rain in in San Francisco. Much more fell in the direct path of the clouds.

Volatility of Gold and Silver.

NUMBER THREE.

We resume the question of the volatility of gold. If gold be actually volatile to the extent indicated by Mr. Napier's experiments, it might be reasonably anticipated that some gold would be found in the flue-dust of the melting furnace, and that some of the precious metal might even fly out into the atmosphere at the top of the chimney. In the experiments communicated to the Chemical Society of London by Mr. Napier, a digest of which was given in our issue of June 13th, analyses of deposits taken from the top, middle, and bottom of a chimney about 35 feet high were given.

A quantity of soot was also collected, as it escaped into the atmosphere, about four feet above the top of the chimney, which, on examination, was found to contain three per cent. of silver, with also a small portion of gold. Soot deposited on a wall against which the chimney stood, was found to contain 4.2 per cent. of silver, also some gold. The most extraordinary feature in these analyses is the presence of gold in such large proportions; the amount being at least double that which originally existed in the alloy which was treated in the furnace. Mr. Napier hazards, in explanation of this curious result, tho view that this excess proportion of gold is carried off by vaporized metallic copper, owing to the greater affinity of the latter for gold.

In Mr. Napier's second series of experiments, [which are also referred to in our issue of the 23d ult.,] the melted metal was not, as in the preceding instance, covered with charcoal; but a number of bone-ash cupels were kept floating upon the surface of the molten metal, for the purpose of absorbing small quantities of lead, which were contained in the silver operated upon.

Here the loss was of very serious amount, while that of the silver was also quite alarming. These losses appear even more serious when we take into consideration the fact that it is only that portion of the metallic substances which lodges on the sides of the chimney that has any chance of being recovered.

In Napier's experiments the alloys melted contained gold as a minor constituent; in the case of the silver coin, the gold formed in this State and Nevada; but only the and in that of the metal for parting, presumably only one-third or one-fourth of the compound, and yet in both cases gold found its way into the flue-dust. With gold containing 96 per cent. of the precious metal, would there be a sensible loss from like causes? The correct answer to this question is, that the same kind of loss occurs; analyses and examinations made with the deposits from the chimneys of numerous melting houses in Australia have always shown the presence of gold in considerable proportion. Similar results have not unfrequently been obtained from the breaking up or cleaning of melting establishments twelve-hundredth part of the alloy, for evident reasons, little has been said about it. Special care has been taken to keep such facts out of the papers.

In melting the low grade product of many of our mines, which often assays as low as $14 per ounce the loss of gold must, judging from the above experiments, be much greater than when melting the product of those mines which yield very fine gold. This is a matter deserving of the most serious attention.

Moreover, the abundant use of nitre and corrosive sublimate in toughening gold, as is sometimes done, occasions violent action in the melting pot; the use of these chemicals causes an additional loss of gold, presumably by mechanical projection, and the question of the cause of the loss of gold in the melter's hand and of the state in which it escapes into the chimney has become far more complex than in our early gold-melting days, when the alluvial gold of high quality was the only material operated upon; and when this, with the addition of a little borax, was simply melted and poured once

In some of the larger melting houses in Melbourne, Australia, there is a considerable length of flue between the furnace and the chimney-shaft, and in these flues, as well as in the shaft itself, a deposit of dust occurs. From flues of this description and from the shaft of one of these establishments the accumulated dust was recently cleared out. The dust from the flues afforded by assay for each pound weight avoirdupois:

	Grains.
Silver	11.554
Gold	3 211
White alloy of gold and silver	14.765

The dust from the shaft, similarly examined, afforded per pound avoirdupois:

	Grains.
Silver	29 54
Gold	14.12
White alloy of gold and silver	43.66

These results, which are reliable, must speak for themselves; they represent the average of what takes place in the ordinary operations of an assaying establishment, performing the usual varieties of work. If a sample of this flue-dust be taken in the hand, and closely inspected, neither gold nor silver will be seen, and if it be re-washed down to a small bulk, the gold will be almost, or altogether, invisible to the naked eye, or to the eye aided by a pocket lens; but if, after washing a sample, we place the residue under a compound microscope with a magnifying power of about ninety diameters, we shall then observe, lying among the stony particles, numerous spherical globules, and groups of crystals of both gold and silver. The little golden spheres are, many of them, exceedingly brilliant, and perfect in form, and they may be readily distinguished as varying from the rich yellow of fine gold to the pale greenish yellow of alloys containing much silver, so that it can be certainly stated that these minute particles widely differ from each other in fineness. If, again, a portion of dust be removed from the flues of a muffle-stove which has been for some time in constant use, very similar results will be also obtained. After washing this dust, little amber-colored translucent spheres, apparently silicate of lead, may be observed under the microscope, and interspersed among these, countless metallic globules tolerably uniform in size but varying in color, and consequently in their proportions of gold and silver much as those in the flue-dust of the wind furnace vary.

If gold be cupelled with lead, but without silver, there is a notable loss of gold; as often as we repeat the operation on the same piece of pure gold, so often we occasion a further loss of weight. But in the cupellation of gold with silver and lead, as conducted in the ordinary assay, there is a palpable loss of silver, but no *apparent* loss of gold; it appears as though the presence of the more volatile silver shielded the gold and prevented its loss. In reality the case is very different from what it appears, for both gold and silver are actually lost, but as the resulting cornet is never pure gold, but always contains a residue of silver, so the real loss of gold is covered and more than covered by the excess of silver which pertains to the cornet after all the operations of the assay.

To make this quite clear, we venture to give an example. If 10 grains of pure gold are cupelled with 30 grains of silver, and 100 grains of pure lead, we shall obtain a cornet weighing a little over 10 grains—say 10.008, the excess of 8,000ths of a grain is considered as silver left in the gold, and an allowance for this surcharge, as it is called, is made in the common assay. But if we now analyze the 10.008 grains of gold obtained as our result, we shall obtain more than 8,000ths of a grain of silver—say 12,000ths; in this case the extra 4,000ths of silver go to cover the loss of the same weight of gold during the cupellation.

CONCLUSIONS.

From these several results we learn that at very high temperatures gold is volatile; that gold melted at the temperature of our common furnaces suffers considerable loss; that the loss is apparently augmented by the presence of other metals, especially by such as are of a volatile nature. We learn, too, that gold passes off in the assay muffle, and that it may be recognized in, and recovered from, the flue dust; moreover, that it actually passes out of the chimney-top into the atmosphere. How far in these several instances it passes off in vapor, and how far it is mechanically swept away in the draught as *gold mist*, if we may use such a phrase, has yet to be determined; for, although the experiments of Napier are conclusive as to the facts brought forward, the deductions which he has made can scarcely be received as final or conclusive.

A BRILLIANT INVENTION FOR BLINDING BURGLARS.—The carrying of weapons has long been forbidden in France to persons in civil life; but a brilliant Parisian invention has lately been made, which, while conforming with the law, is a partial aid as a means of defence against burglars and other night robbers. It consists of a *horn*, inserted in the end of a cane, which horn contains an electric battery and a small *lamp* with two powerful reflectors. The intensity of this light temporarily blinds any person at whom it is pointed. The lamp is kindled at will by pressing a small knob at the other end of the cane, which knob communicates with an electric wire.

Locomotives in Mining Tunnels.

EDITORS PRESS.—The inclosed calculations and queries are sent with the request that they be published in the MINING AND SCIENTIFIC PRESS, for the purpose of obtaining the facts in regard to the feasibility of running engines in tunnels for mining purposes at a reasonable degree of expense. If that could be done, it would add much to the value of Sierra County; and of course, to all places where gravel deposits lie far back into the hills. The conditions of the calculations apply to all companies just begining to operate in this immediate locality; but before they get worked out, they will have to car at least a mile. If you publish the communication, please make such notice or comment in regard to it as you may see fit. The companies are all anxious to know if engines can be used in carrying. Truly yours, J. F. COLE.

The following are the calculations and queries above referred to:

Company A employs five carmen on a main track tunnel, 2,500 feet in length, with an ontward descent of six inches per hundred feet, or about twenty-eight feet per mile, running at the rate of sixteen trips each, on a shift, with loaded cars weighing 3,000 pounds each. The cost of that carrying for a year would be, for five men by day and five by night, ten men working, say 300 days each, at $3½ per day, $10,500.

If a locomotive could be used the cost per year would he—

Cost of locomotive and apparatus	$3,000	
Interest and repairs per year	451	
Fuel	2,400	
Engineer	1,200	
Amount of cost first year	$7,050	
Balance in favor of locomotive		$3,450
Balance, second year		6,450
" third "		6,450
" fourth "		6 450
Saved in four years		$22,800

Suppose two companies are situated so that the same locomotive could be used by both, and instead of performing the work of ten men per year, it could do the work of twenty men, with the above conditions; then the estimates would be the labor of twenty carmen for 300 days each, at $3½ per day, $21,000. Cost of engine per year, $7,050.

Balance in favor of engine first year	$13,950
Balance in favor of engine second year	16,950
Balance in favor of engine third year	16,950
Balance in favor of engine fourth year	16,950
Amount saved in four years	$61,800

The importance of the following queries are manifest and positive: Can an engine be used in a tunnel three and one-half feet wide by five feet high, with ample ventilation, so that the heat and steam will not interfere? What kind of fuel could be best employed—coal, petroleum, oil, charcoal, coke, or what? Can the smoke be condensed or consumed, or a jet of steam be employed to destroy its noxious qualities? How many empty cars, weighing 1,000 pounds each, could a 40-cwt. engine draw up a grade of forty feet per mile, at a maximum rate of five miles an hour? Have locomotives ever been used in tunnels; and if not, why not, where the operations are extensive enough to justify the outlay?

Answers to any one or all of the above queries, through the columns of the PRESS, are respectfully solicited. Could engines be used in caring, they would add untold wealth to the State. There are large tracts that would unquestionably pay, if the caring cost, at the outside, sufficiently less than by ordinary means.

Table Rock, Sierra Co., June 28, 1868.
J. F. C.

In place of according to Mr. Cole's inquiry the customary brief observations which only can be afforded by the limited space at our disposal in the column set apart to Notices to Correspondents, we have preferred to publish his letter *in extenso*, deeming the inquiries of sufficient importance. The subject matter of inquiry is not one on which we can pass any opinion, so far as personal experience is concerned. We have, however, made some inquiries on the subject, and one gentleman states that in South Wales, the iron ore, raised in such immense quantities in that district, is in several places drawn in cars through tunnels by a small locomotive. This, he states, has been the case for many years, and is given from his own positive knowledge. Coals, he states, as he has been informed, have also been withdrawn in a similar manner. He also states that rails, three feet six inches apart, would amply suffice for the purpose, or possibly even of narrower gauge; as railroads of that narrow gauge have been found well adapted for the formation of an ordinary railroad of some length in a hilly district of North Wales, an account of which was recently published in the MINING AND SCIENTIFIC PRESS. We think, however, the party alluded to, concurs in the opinion, that a hight of five feet would scarcely suffice to render the inconvenience of the waste steam from becoming very troublesome and annoying. To remedy this drawback, the gentleman named suggests that for the purpose of obtaining tractive power, in place of employing a locomotive, an endless rope might be used, worked by a revolving drum, set in motion by a stationary engine at the mouth of the tunnel. The tunnels in England have been worked in this way since the opening of the Manchester and Liverpool Railway, in 1830, one tunnel being about a mile and a half, and another a mile in length.

Ross Browne's First Report.

We are indebted to Prof. W. P. Blake for some advance sheets of J. Ross Browne's second and final report upon the "Mineral Resources of the States and Territories west of the Rocky Mountains." The sheets before us comprise 176 pages. The Professor writes us that at the date of mailing the imperfect copy sent, the entire volume, which contains 700 pages, was already out of the press, and in the hands of the binders, so that we ought to receive the balance of the work soon. Upon tho first of the pages before us, we find the following as the heads of the various points to which special attention is given in the report:

1. The origin of gold mining on the Pacific Coast and present condition of that interest, as tending to show the progress of settlement and civilization.
2. Geological formation of the great mineral belts and general characteristics of the placer diggings and quartz lodes.
3. Different systems of mining, machinery used, processes of reducing the ores, percentage of waste, and net profits.
4. Population engaged in mining, exclusively and in part, capital and labor employed, value of improvements, number of mills and steam engines in operation, yield of the mines, average of dividends and losses.
5. Proportion of agricultural and mineral lands in each district, quantity of woodland, facilities for obtaining fuel, number and extent of streams, and water privileges.
6. Salt beds, deposits of soda and borax, and all other valuable mineral deposits.
7. Altitude, character of climate, mode and cost of living, cost of all kinds of material, cost of labor, etc.
8. Population of the mining towns, number of banks and banking institutions in them, facilities for assaying, melting and refining bullion; charges upon the same for transportation and insurance.
9. Communication with the mines and principal towns, postal and telegraphic lines; stage routes; cost of travel; probable benefits likely to result from construction of the Pacific railroad and its proposed branches.
10. Necessity for assay offices and public depositories; what financial facilities may tend to develop the country and enhance its products.
11. Copies of local mining laws, and customs regulating the holding and working of claims.
12. Number of ledges opened, number claimed, character of the soil in the mining districts, and its adaptation to the support of a large population.

The 176 pages before us, after a few preliminary remarks, are entirely devoted to the consideration of so much of the first point enumerated as relates to California. In presenting the present condition of the mining interest of this State, each county is considered separately, and each of the principal mines in the several counties is separately examined and reported upon. The report is evidently very elaborate, and we have no doubt it will furnish a large amount of valuable information—far more than will be considered commensurate with its cost. We shall speak more fully of it when we have the entire document before us.

Since the above was in type, Mr. Browne has laid upon our table the report complete, but too late for further examination this week.

Mechanical.

The Durability of Materials.

NUMBER II.

The durability of metals, like that of organized substances, depends mainly on the resistance they offer to a combination with oxygen; and thus their decay may also be regarded as a slow combustion. But their durability further depends on the character of the oxides formed on their surface. Iron exposed to moisture will soon be coated with rust, in the form of hydrated peroxides; and as the oxides do not adhere to the surface, additional flakes constantly form and fall away, until the whole mass is destroyed. Wrought iron in a pure dry atmosphere suffers, practically speaking, no deterioration in any lapse of time. It is extremely durable in distilled water free from air; but it is slowly oxidized in a moist atmosphere, and with fatal rapidity in air or water containing free acids or other corrosive agents. It is, however, efficiently protected from such agents by paint, which adheres to clean iron with great tenacity. It is also a fact, not hitherto satisfactorily accounted for, that oxidation is to a great extent arrested by vibration. The painting of wrought-iron girders and roofs, more especially in the neighborhood of smoky towns, is a precaution of the utmost importance. Every care should be taken to expose the iron as freely as possible to the air, to leave no hollows where water can collect, to avoid the contact of damp earth, and especially of vegetation, and to throw the material into the form of heavy bars rather than thin plates. Painting is more economically performed, and more effectual, when constantly attended to, than under the vicious practice of laying on three or four coats, and then leaving the work for years, till the paint all peels off, with a layer of rust attached to it.

The Britannia Bridge furnishes a striking illustration of the value of this system. The maintenance had been effected by two or three men, constantly on the work, who attended to the slightest symptom of local discoloration. As a consequence, the author did not hesitate to express his firm belief, that the total loss from rust of the 10,540 tons of which the tubes consisted, did not in twenty years amount to a single pound weight.

Cast iron, when exposed to the action of sea water, slowly decomposes the iron; being dissolved, leaving behind a graphite or plumbago. The action is, however, superficial, and very slow. It can be preserved by painting, where accessible for that purpose, or by any protection which prevents continual renewal of the surrounding medium, as when inclosed in brickwork or masonry. In fresh water it suffers no such deterioration, and under ordinary circumstances its durability in a pure atmosphere appears unlimited.

In the case of zinc, although the bright metal oxidizes even more rapidly than iron, yet the oxide adheres with such tenacity to the metal that it affords an efficient protection against the continuation of the process. To this property the metal owes its great durability, more especially as its oxide is insoluble in water. In the presence of any solvent of the oxide, this metal is so speedily destroyed as to be practically useless, unless protected by paint. The destruction of zinc in smoky districts is, however, principally due to galvanic action. A similar action produces the rusting away at the base of iron railings, when fixed in stonework, as is usually the case, by being run in with lead. The contact of copper with the iron plates of a vessel is also a source of great danger; and there are numberless other instances in which the contact of metals of different conducting powers is equally destructive. In all such cases the use of paint furnishes, at any rate, a temporary remedy.

It is difficult to over-estimate the value of the introduction of the process of coating iron plates with zinc, by simply cleaning and immersing them in the molten metal. All that has been said on the subject of zinc applies equally to galvanized iron, as it is called. In a clear atmosphere its great durability, its stiffness, its freedom from expansion, and its economy, are all qualities of the highest value; while, on the other hand, without constant painting, it is wholly unfitted for the atmosphere of smoky towns, or manufactories, or even stations where it is exposed to the fumes from locomotives. Both the corrosive and the galvanic actions, which in such cases are so destructive, do not cease with the destruction of zinc, which is soon affected but continues also to act, with fatal effect, upon the iron itself, as may be seen in many railway stations and sheds near the manufacturing towns. The corrosive tendency in zinc and iron obliges the use of less oxidizable metals, copper and lead. Lead slowly absorbs oxygen and carbonic acid in moist air. It is acted upon by certain waters, and is occasionally riddled with holes by the larvæ of an insect; and its expansion and contraction requires to be allowed for in its use. Its ductility render it a valuable material. Copper might, however, in many instances, be used with great advantage in its stead.

The action of sea water on copper is so important that it was particularly alluded to. The object in covering a vessel with copper is solely to prevent the adhesion of barnacles and other molluscs. This property is not due to the poisonous quality of its salts, as is sometimes asserted, nor is copper used on account of its durable qualities; on the contrary, its value depends on its slow destruction. The chloride of copper formed beneath the attachment of the barnacle being a soluble salt, the creature no sooner effects a lodgement than it is at once set free by the solution of the salt; while the salts which forms on zinc or iron being insoluble, the plate is rather protected than otherwise by the tenacious parasite. Hence the difficulty of devising an efficient paint for iron ships; for while, on the one hand, it must be slowly soluble in water to prevent this adhesion, it must, on the other hand, be sufficiently insoluble to be durable. Ordinary oil paint is the most efficient material for protecting either metals or wood from the effects of moisture and air; but all oils, resins, and gums exposed to air, and especially to the light of the sun, oxidize and burn away with more or less rapidity, leaving a powdery residue behind. As a preservative of paint against the heat of the sun and light, attention was directed to the virtue of a coating of silicious sand, dredged on the paint while wet.

The durability of matter is a subject of the highest philosophical interest. The universal law on this planet appears to be that no form shall be permanent. Never-ceasing destruction and reconstruction are characteristic, within the range of the atmosphere, of everything that exists, whether as regarded organic life or inorganic matter; and it is probable that even the atmosphere itself is subject to the same decree.

Excellent Emery Wheels, which may be used with water, as are grindstones, are made by dissolving gum shellac in alcohol, mixing the emery with it and pouring and pressing in molds. Good wheels may also be made by a mixture of glue, dissolved, and emery, treated in a similar manner. Ordinary wheels are made by covering the periphery of a wooden disk, suitably secured to a mandrel, with folds of woolen or canton flannel, and covering the whole with leather or strong cloth. Upon this is placed a coating of emery secured by zinc.

The town of Winchendon, Mass., claims to manufacture more wooden ware than any other town in the world. Two of the largest firms turn out $500,000 and $200,000 respectively, and the smaller establishments of the place make the aggregate annual product of the wooden ware interest mount up to over $1,000,000. In addition to these factories, Winchendon contains two cotton mills, two bobbin mills, two machine shops, and two sewing machine manufactories.

Steel is successfully alloyed with other metals, improving its qualities for some purposes. One five hundredth part of silver adds immensely to the hardness of steel and yet increases its tenacity. One hundredth part of platinum, though not forming so hard an alloy as the silver and steel, gives a very great degree of toughness. Rhodium, palladium, iridium, and osmium, make steel very hard, but their use, from their cost, is confined mainly to the experimental laboratory.

Drilled vs. Punched Holes.—A large number of specimens of steel plates were recently tested at Chatham Dock-yard, to determine the difference in strength between steel plates with punched and drilled holes. The advantage in tensile strain, gained when the holes are drilled rather than punched, was calculated to be 22.5 per cent.

During the summer, twelve or fifteen large iron furnaces are to be erected in Lehigh County, Pennsylvania.

Scientific Miscellany.

Science in the Arts.

A somewhat remarkable instance of the value of science to the arts is exemplified in the recent development of a new industry, under the direction of Messrs. Maumené & Ragelet, of Paris. This is pronounced one of the most singular discoveries in the history of agriculture. It has long been known that sheep draw a considerable quantity of potash from the land upon which they graze, much of which is excreted from the skin with the perspiration of the animal; and it has been shown by Chevreul that this peculiar potash compound, which is known as "suint," forms no less than one-third the weight of raw merino wool; while of ordinary wools it constitutes about fifteen per cent. of the fleece.

As this compound is soluble in cold water, it is easy for the wool manufacturer to produce a more or less concentrated solution of the same, and from which the potash may be recovered by an appropriate treatment. The process of this treatment constitutes the new industry alluded to, and which is now being introduced into the principal woolen manufactories of France. The plan adopted by Messrs. Maumené & Ragelet is a very simple one, and is described as follows:

They evaporate the solutions which are sent to them, until a perfectly dry and somewhat charred residue has been obtained. This is placed in retorts and distilled, very much in the same manner that coal is distilled at gas-works; and the result is that, while much gas is evolved, which can be used for illuminating the factory, and much ammonia is expelled, which can be collected and utilized in many ways, there remains a residue, which chiefly consists of carbonates, sulphate, and chloride of potassium. These three salts are separated by the usual method, and then pass into commerce. Curiously enough, they are remarkably free from soda.

Some idea may be formed of the prospective magnitude of this new industry, from the fact that there are nearly 50,000,000 fleeces washed annually in France, which would yield, if all subjected to this process, not less than $2,800,000!

Sheep feeding, it is well known, is very exhaustive to the soil. The facts above developed make clear the manner in which this deterioration occurs, and points out the remedy. The potassic constituents so extensively drawn upon must be supplied; it is a duty the farmer owes to the soil,—the neglect of it is but little short of a crime to the community. The entire development of the above series of facts affords a most practical illustration of the value of science in the arts.

Passage of Hydrogen through Iron at a Low Temperature.—Not long ago we gave some account of the transmissibility of gases through cast iron at high temperatures. To-day we give an interesting experiment which shows that hydrogen will pass through cast iron at the ordinary temperature. M. Cailletet took an iron flask with a long (curved) neck, exhausted the air from it, and placed the mouth under mercury. The body of the flask was then set in a vessel of dilute sulphuric acid. The outer surface was, of course, attacked by the acid and hydrogen evolved, some of which passed into the interior of the flask, and, driving out the mercury, escaped in bubbles from the trough. There may be more in this experiment than M. Cailletet suspects. Hydrogen passes into metals with most remarkable facility, and Mr. Graham believes is liquified with them.—*Mechanics' Magazine.*

Electricity in Vacuo.—Mr. Alvergniat, of Paris, has constructed a new apparatus for proving that electricity cannot pass through an absolute vacuum. Two platinum wires are inserted into a tube so that their free ends are within about an eighth of an inch of each other. The air is then exhausted from the tube by means of a mercurial column, after which the electric spark will not pass from one platinum wire to the other.

A Saturometer.—M. Coret has recently devised an instrument—a saturometer—which is intended to be affixed to steam boilers which use salt water, to determine the degree of saturation and at the same time to record the level of the water in the boiler. The action of the instrument depends on the well-known principle that when two different liquids, having the same temperature and no chemical affinity, are placed in an inverted syphon, their lights in each column, under the condition of equilibrium, will be inversely as their densities. Two glass tubes, communicating with each other at the bottom, are placed side by side with a graduated scale between them. One tube is connected with the feed-water, and the other with the water in the boilers; so arranged that when the comparison is to be made the connections are cut off. It is said the accuracy of this apparatus permits a nearer approach to the point of saturation than formerly, thus obviating the difficulties and loss of heat arising from an unnecessarily frequent "blowing off," to remove the excess of saline deposits from the boiler.

To Electro-Plate Paper or other Fibrous Material.—A mode has been devised for depositing copper, silver or gold, by the electric process, upon paper or any other fibrous material. This is accomplished by first rendering the paper a good conductor of electricity, without coating it with any material which will peel off. One of the best methods is to take a solution of nitrate of silver, pour in liquid ammonia till the precipitate formed at first is entirely dissolved again; then place the paper, silk, or muslin, for one or two hours in this solution. After taking it out and drying well, it is exposed to a current of hydrogen gas, by which operation the silver is reduced to a metallic state, and the material becomes so good a conductor of electricity that it may be electro-plated with copper, silver or gold in the usual manner. Material prepared in this manner may be employed for various useful and ornamental purposes.

Combustion.—The perfect combustion of one ton of anthracite coal or of coke, requires over 5,970 pounds of oxygen, derived from about 340,000 cubic feet of air at ordinary temperature, equivalent to a column one foot square and over sixty-four miles in length. This calculation is based upon the supposition that all of the oxygen of the air is made available, but in practice it is found necessary to introduce twice the quantity of air that by calculation would be sufficient.

In the conversion of one part of solid carbon into carbonic oxide, there are involved 2,473 heat units. In the conversion of the carbonic oxide thus obtained, into carbonic acid, there are involved 5,607 heat units, making 8,080 heat units in all, of which the first or imperfect combustion yielded but thirty-one per cent. of the obtainable heat; so that to limit the supply of air so as to cause the exclusive production of carbonic oxide, would necessitate the use of three times as much fuel as would be required to do the same work were it properly burned.

Gilt Wire.—The gilt wire employed in making gold lace soon tarnishes. The surface of gold seldom being perfectly continuous, sulphur gets at the metal beneath, whether copper or silver, and the wire quickly blackens. To avoid this result, M. Helouis proposes to insert a thin layer of platinum between the copper and the gold. To do this, he drives a bar of copper into a ring of platinum strongly heated. The contraction of the platinum on cooling fixes it firmly to the copper, and the wire may be drawn without any risk of separating the two metals. The gilding may be done as usual. The color obtained is as good as that of silver gilt wire, and, of course, lasting, for sulphur will have no effect on the platinum.

In 1829, there were but three miles of railway track in the United States; to-day there are not less than 38,500 miles. The railroad business of the Union employs about 500,000 men.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

ISSUED FOR THE WEEK ENDING JUNE 23, 1868.

79,076.—IMPROVED SAFETY GUARD FOR MINING SHAFTS.—E. O. Leermo, of Gold Hill, Nev.:

The combination with a railroad track and the cage of a mining shaft of the automatic safety guard attachment, substantially as and for the purpose described.

The combination of the spring buffer H, spring lever E, and slide D, substantially as and for the purpose described.

79,115.—IMPROVED DRILL STOCK.—Martail Hainque, San Francisco, Cal., assignor to self and John Lowth, of same place:

The combination of the drill stock "A," with the bar "D," the plain or corrugated git C, and the sieve "B," the said parts being constructed and arranged substantially as described.

79,156.—IMPROVEMENT IN CHURNS.—Andrew Stump, Bodega, Cal., assignor to self and Chas. Colby:

In combiuation with the revolving box A, the interior revolving sbaft F, aud arms c, c, together with the clasp H, and pin I, the whole constructed and operating substantially as and for the purpose described.

The object of this invention is to provide an improved churn, hy which the cream can be thoroughly agitated, and more speedily converted into butter than can be done hy churns in ordinary use. This is dono hy constructing a long box, of any convenient shape, although one whose cross sections shall be square is deemed preferable. This box is supported horizontally, and revolves upon spindles at either end. A second shaft passes through the box, bearing arms, and is revolved hy a crank in an opposite direction to the motion of the churn, until butter is formed, when it is fastened so as to remain stationary while the box is being revclved. By means of these opposite motions, it is claimed that tbe cream is most successfnlly agitated to accomplish the purpose desired.

70,199.—IMPROVEMENT IN SEWERS.—Jesse Brown, San Francisco, Cal.:

The protective cap when constructed and arranged as described, so as to secure the upper and lower drains of privies, as set forth.

79,232.—IMPROVEMENT IN TICKET PUNCHES. Robert James Kellett, San Francisco, Cal.:

Having described my improvements in ticket punches for railroads, steamboats, etc., I will state, that in combination with a ticket punch provided with a device for removing a coupon or portion of a ticket and having a box or receptacle arranged to receive the portion so removed,

I claim a small auxiliary punch, so arranged as to punch a hole in the coupon or portion so removed at tho same operation which removes or punches the coupon or portion of the ticket; thus providing a convenient means for stringing said coupons or portions for preservation and reference as described.

79,274.—IMPROVEMENT IN RECIPROCATING STEAM ENGINES.—David Stoddart, San Francisco, Cal.:

I claim the arrangement of the pistons B', B², small pistons D', D², valve c, and tho passages H', H², communicating to the cylinder substantially as described.

RECENT INVENTIONS.

A NEW GRATE FOR FURNACES.—In the ordinary form of furnace grates the bars of iron are made stout enough to sustain the weight of the coal, even after being weakened by heating, and, as a consequence, much of the coal resting on the iron is not brought into contact with air, and its gases are driven off unconsumed, causing the dense black smoke escaping from the chimneys, when bituminous coal is burned. An arrangement has lately been patented in England, by which the air is admitted to all parts of the burning mass, and the smoke almost entirely consumed, with a great reduction in the amount of ashes.

A NEW USE FOR GUTTA PERCHA.—Quite a new use for gutta percha has recently been devised, which is causing considerable excitement among the paper-hangers and paper-makers. This novelty is a preparation of the gum in question, in thin sheets, for covering the interior walls of dwelling houses. Such a fabrication if made ornamental and practical in application, must exceed in durability and imperviousness to moisture, anything which has yet been devised.

NEW BEARING FOR PERPENDICULAR SHAFTS.—The Nevada *Transcript* describes what appears to be a useful contrivance for overcoming the friction of perpendicular shafts: The shaft being square at the base rests upon hardened steel balls, and the halls rest upon the steel forming the socket. The shaft revolves upon tbe balls and turns almost without friction. One at work in Fisher's machine shop has a shaft weighing three hundred pounds, which could be made to revolve three times with one effort of the hand. It was tested with a shaft weighing seven hundred wounds without any perceptible increase of friction. The invention will be found very useful for flouring mills and all other machinery where perpendicular shafts are used. The *Transcript* adds, that it has been examined by many practical mechanics, and pronounced by all who have seen it an excellent invention.

Notices of Recent Patents.

78,669—IMPROVED PLATE FOR ARTIFICIAL TEETH.—D. S. Hutchinson, San Francisco, Cal.:

I claim a flexible cavity plate, having in part or in whole the palatine portion of the plate made of flexible material D, in connection with a compound cavity or series of cavities, united or otherwise, with a cavity on the center or palatine portion of the plate and upon the internal or external (or both) borders of the alveolar ridge, substantially as and for the purpose specified.

The object of this invention is to provide a plate for artificial or false teeth so constructed that there will be no danger of their loosening and dropping down when in use, and also to prevent the plate from irritating the palate, especially where the tissues of the alveolar and palatine arches are of unequal hardness. The invention consists in having cavities of any desired form upon that portion of the plate corresponding to the external and iuternal borders of the alveolar ridge of the mouth, and connecting or not, as is desired, with a chamber or cavity upon the central portion of the palatine arch; also, iu having that portion of the plate which rests upou the palatine arch, or any part of it, composed of a flexible material or compound, thereby securing a more perfect adhesion of the atmospheric plate to the roof of the mouth. The flexihle material is applicable to all kinds of plates, such as gold, silver, platinum, porcelain or vulcanite base.

78,703.—IMPROVED SPURS.—Sam. Wehrly, San Francisco, Cal., assignor to self and E. V. Sutter, of same place. (Antedated May 4th, 1868.)

I claim a spur having the dog *o*, the rack *m*, aud arm *d*, togcther with the spring *c*, and slotted plate *b*, the whole constructed and operating substantially as and for the purpose described.

The object of this invention is to provide an improved spur for horsemen. It consists principally in an improved mechanism for attaching the spur quickly and firmly to the boot, and dispensing with the screw or strap generally used. By this device a neat and substantial spur is obtained, which is free from the usual difficulties of attaching and taking off. There is little or no liability of its loss, a fact which makes it especially valuable for military use by cavalry.

78,825.—IMPROVED FORGING APPARATUS.—Nelson Peterson and Geo. W. Jones, Antioch, Cal.:

1. The bar H, with its slotted lever N, screw P, and spring I, in combination with tbe link J, and handle B, substantially as described.

2. We claim the bearings E, having the recesses d, d, d, for supporting the axle D, so as to allow the hammer to be used on any part of the anvil, substantially as described.

The object of this invention is to provide a spring-hammer for smith's use, which can be readily turned to any portion of the anvil, and which can be conveniently operated by the foot without the assistance of a helper. The hammer is raised by a spring, either flat or spiral, while by a treadle conveniently situated, the smith can bring the hammer down with any required degree of force. By turning the hammer over, the toe or point may be used when desirable. Any sized hammer may ho used by increasing the power of the spring to lift it.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

Mining Share Market.

Since the reassembling of the Board on the 8th inst., after a holiday adjournment of several days, the general list usually dealt in has been somewhat broken up, and sales have been quite irregular, generally showing a tendency to lower prices. Outside dealers show more of a disposition to invest under these circumstances, and at the close the market exhibited no improvement.

The attention of our readers is called to the annexed interesting tabular statement for the quarter ending with June. It will he noticed that in some respects it is incomplete, as, for instance, the hullion product of the Yellow Jacket Company was reported previously to the present year, while for 1868, owing to the reticence of the officials at Virginia, we have been unable to give them. Otherwise, so far as reported, the hullion product is in the main correct:

Company.	Highest Price.	Lowest Price.	Bullion.	Assessment.	Dist'd.	Highest Price.	Lowest Price.	Bullion.	Assessment.	Dist'd.	Highest Price.	Lowest Price.	Bullion.	Assessment.	Dist'd.

For want of space, the following mining companies have not been included in the above statement: Assessments—Julia, in April, $5,000; United States, in April, $12,000, in May, $4,000; Union, in June, $6,000—total, $27,000. Dividends—North Star, in June, $15,000; Bacon M. & M. Co., in June, $8,000; and Golden Rule, $1,500—total, $24,500.

SAVAGE—declined from $160 to $136, and at the close sold at $139. During the week ending July 4th, 1,495 tons of ore were extracted, showing an approximate assay value of $39 58; previous week the value per ton, upon the same basis, was $44 60. The decrease is due to the lessened product of first class ore. The south mine, on the fourth station, continues to yield the largest amount, having contributed 1,072 tons, of the amount reported, during the week under review. The south mine, on the fifth station, is said to improve as they go south, and it is believed that the ore from this locality will soon he up to the value of that from other parts of the mine. The drift is over thirty feet from the line. At the sixth station work has been somewhat delayed on account of necessary repairs at other points. A dividend of $15 per share, or $300 per foot, is payable since the 10th instant, after paying which a surplus of about $85,000 remains in the treasury. The bullion product o the first six months of 1868 amounted to $1,528,170, against $1,815,000 same time in 1867. The annual meeting takes place on the 16th instant.

IMPERIAL—receded from $140 to $115, then sold at $128, and closed at $123. On the 7th of July the drift from the Imperial-Empire shaft was in seventy feet, and the side drift, running south, sixteen feet—neither showing ore. The progress in these drifts is about four feet per day. The daily product of ore is about eighty tons—seventy from the Alta and ten from the Holmes mine. According to our tabular statement, the hullion yield during the first half of the present year aggregates $355,987 against $618,744 same time in 1867.

CROWN POINT—sold at $96 at the close of Board transactions on the 3d inst., improved to $98, then sold at $91, and at the close realized $89. A dispatch of the 10th states that the south drift, now about 200 feet from the line, is generally poor; however, the upper floors are said to he improving. The drift from 900 station is in twenty-two feet, and running in softer rock. A dividend of $7 50 per share is payable on and after to-day, leaving a halance in the treasury of about $40,000. The bullion receipts during the first six months of 1868 aggregated $630,911; same time in 1867, $558,913—difference in favor of 1868, $72,000. In the first six months of 1866, this company disbursed dividends amounting to $174,000; in 1867, $264,000, and in 1868, $150,000.

OVERMAN—declined from $75 to $62 60, and closed at $69. From the comprehcusive annual report submitted to the stockholders on the 9th inst., by the Secretary, we make the following extracts:

RECEIPTS.

Cash on hand last report	$53,784 02
Bullion	328,965 62
Ore sold	4,652 24
Assessments	112,897 50
Other receipts	3,554 60
	$498,853 98

DISBURSEMENTS.

Reduction expenses	$260,944 29
Labor	98,094 29
Lumber and wood	35,580 17
Legal expenses	8,990 00
Salaries	7,382 37
Other expenses	35,578 40
Cash in Superintendent's hands	9,016 43
Cash in treasury	43,168 03
	$498,853 98

During the fiscal year, 19,208 tons of ore were reduced, yielding $16 86 per ton, and 1,106 tons were sold, averaging $4 26 per ton. Cost of mining the above amount of ore, $6 68 per ton.

KENTUCK—sold at $392 50@383, and at the close realized $392 50. The total receipts of this company, during the month of June, amounted to $122,122 77, of which $120,766 45 was hullion, and the expenses aggregated $67,216 42, leaving an earned halance of $54,906 35. A dividend of $25 per share will be paid on the 20th inst. During the first six months of 1868, the bullion yield was $569,591 against $543,886 in 1867. In first six months of 1867, $200,000 were disbursed in dividends, and same time in 1868, $170,000.

HALE & NORCROSS—has been in the market to a large extent, declining from $74 to $65, then selling at $71, and closing at $69. Nothing of special interest from the mine. The hullion returns for the first half of 1868, foot up $287,773 against $644,373 same time in 1867, and $337,822 in 1866. In first six months of 1866 distributed $60,000 in dividends; same time in 1867, $200,000, and in 1868, none.

CHOLLAR-POTOSI—sold at $230@212, and closed at $214. Considerable trouble is experienced in the lower levels, by the large flow of water. The drift is over 74 feet from the 1,100 station. Ore product during week ending July 3d, 1,050 tons. Bullion yield first six months in 1868, $299,085; same time in 1867, $1,190,383, and in 1866, $441,454....GOULD & CURRY sold at $114@100. Work continues on the shaft. The only hullion received the past six months was in January, amounting to $14,476. In first six months of 1867 received $346,906, and same time 1866, $900,132....CONFIDENCE sold at $30@38. From 399 tons of ore reduced in June, obtained bullion amounting to $8,625 51.

EMPIRE—has been inactive, selling on the 3d inst. at $145@150. Drifts progress slowly in porphyry and hard ground. Bullion receipts first half of 1868, $104,538; same time 1867, $154,339, and 1866, $200,277....GOLD HILL QUARTZ sold at $90@85. Reduced 590 tons of ore in June, showing a yield of $12,051 32. Assets on the first of July, $16,300, deducting liabilities—$8,200—leaves a halance of $8,100....SEGREGATED BELCHER obtained $4,345 in hullion from 250 tons of ore recently reduced. ....On the 8th inst., the OPHIR shaft was 332 feet in depth....NORTH STAR will disburse usual dividend of $5 on the 15th inst.

City Stocks.

We note sales of California Steam Navigation Co. at 70½ per cent.; Spring Valley Water at $68@66; Omnihus Railroad $70, and North Beach and Mission Railroad $67. Within the week numerous dividends have been declared by the various local institutions, as follows: Savings and Loan Society, (semi-annual) 10 per cent. per annum, free from Federal tax, payable since the 10th instant; Odd Fellows' Savings Bank, (semi-annual) 12 per cent per annum, payable on and after 15th instant; Farmers' and Mechanics' Bank of Savings, 10 per cent. per annum—free of Federal tax—for the six months ending January 1st and July 1st, 1868, payable on and after the 15th instant; German Savings and Loan Society, recently organized, 9½ per cent. per annum upon ordinary deposits, and 11 2-5 per cent. per annum upon term deposits, payable on and after this date. Pacific Insurance Company, pays 1 per cent. per month for the quarter ending June 30th, payable since the 10th instant, and Union Insurance Company, 1 per cent. for same time and payable same date. From the annual report of the latter company, which was submitted on the 8th instant, we learn that the income for the year was $350,586, including $128,782 for fire risks and $142,866 for marine risks. The disbursements for the same time amounted to $308,323, including $96,954 for fire losses, $99,731 for marine losses, and $45,000 for dividends to stockholders. The cash surplus above capital is $176,937. The amount of risks covered during the year was $20,567,325, of which $12,351,287 was fire and the halance marine. On the 30th of June the risks in force amounted to $11,688,454, of which $10,803,326 was fire. The outstanding risks of both the San Francisco and National Insurance Companies, recently disincorporated, havo hecn transferred to the Liverpool and London and Globo Insurance Company. On and after the 15th instant the Front Street, Mission and Ocean Railroad Co. dishnrse a dividend of 1½ per cent. per month, for the three months ending June 30th, on the amount paid in on the preferred stock. At the close, Pacific Ins. stock sold at $120.

BREAKING GROUND.—Immediately after the oration on the Fourth at Petaluma, the assemhlage repaired to the initiatory point of the Sonoma County Railroad, where the first ground was broken for the construction of said road.

A FARMERS' CLUB has been organized in Santa Clara, and the Alameda *Gazette* reports one of the conversations, the topics of which are quite interesting.

SPECTACLES.—The finest article is to be found at Müller's, 205 Montgomery street, near Bush. Give him a call. *

Corporation Assessment Law.

Frequent calls for copies of the Act governing the levying and collecting of assessments of all incorporated companies in California, has induced us to publish the law.

AN ACT Concerning Assessments upon the Stock of Corporations.

[Approved March 26, 1868.]

The people of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. The Trustees of any corporation, formed under the general laws of this State, shall have power to levy and collect, for the purpose of paying the proper and legal expenses of such corporation, assessments upon the capital stock thereof, in the manner and form and to the extent hereinafter provided, and not otherwise.

SEC. 2. No one assessment shall exceed five per cent. of the stated amount of the capital stock of the corporation, named in the articles of incorporation, and none shall be levied while any portion of any previous assessment shall remain unpaid, or uncollected, except in cases where all the powers of the corporation shall have been exercised in accordance with the terms of this act, for the purpose of collecting such previous assessment, and except, also, the collection of a previous assessment against one or more stockholders, restrained by injunction or otherwise; in which case, further assessment may be levied and collected according to this act.

SEC. 3. No assessment shall be levied except by order of the Board of Trustees, concurred in by a majority of said Board, and entered upon the records of the corporation.

SEC. 4. Every order levying an assessment shall specify the amount thereof and the time when the person or persons to whom and the place or places where the same is payable. It shall also appoint a day subsequent to the full term of publication of the assessment notice on which the stock upon which assessments remain unpaid shall be deemed delinquent, which said day shall not be less than thirty, nor more than sixty days, from the time of the making of the said order levying the assessment, and a day for the sale of delinquent stock, which shall not be less than fifteen, nor more than sixty days from the time appointed for declaring said stock delinquent.

SEC. 5. Upon the making of such an order, the Secretary shall cause to be published immediately a notice thereof in the following form:

"[Name in full.] [Location of works.] Notice is hereby given that at a meeting of the Trustees of said Company, held on the [date], an assessment of [amount] per share was levied upon the capital stock of said Company, payable [when, to whom, and where, particularly]. Any stock upon which said assessment shall remain unpaid on the [day fixed] shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the [day appointed], to pay the delinquent assessment, together with cost of advertising and expenses of the sale. [Signature of the Secretary, with particular location of office.]"

SEC. 6. Said notice shall be published once each week for four successive weeks in some daily or weekly paper published at the place designated in the articles of corporation as the principal place of business of the corporation, and also in some paper published in the county in which the works of the corporation are situated, if a paper be published therein; *provided*, that if the works of the corporation are not situated within some State or Territory of the United States, then a publication in a paper of the County shall not be necessary; *provided, also*, that if there is no newspaper published at the place designated as the principal place of business of the corporation, then the publication shall be made in the newspaper published nearest thereto; and *provided, also*, that the notice specified in the 5th section of this act may be served by delivering a copy thereof, certified by the Secretary, to each stockholder personally, and in case of such service, upon all the stockholders, of said corporation, then no notice by publication shall be necessary, and such personal notice shall be deemed complete.

SEC. 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for declaring the stock delinquent, the Secretary shall, unless otherwise ordered by the Board of Trustees, cause to be published in the same papers in which the notice provided for in Sec. 5 shall have been published, a notice substantially in the following form:

"[Name in full. Location of works.] *Notice.*—There is delinquent upon the following described stock, on account of assessment levied on the [date,] [and assessments levied previous thereto, if any,] the several amounts set opposite the names of the respective shareholders, as follows: [Names, number of certificate, number of shares, amount.] And in accordance with law, and an order of the Board of Trustees, made on the [date,] [if any such order shall have been made,] so many shares of each parcel of said stock as may be necessary, will be sold at the [particular place,] on the [date] at [the hour] of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale. [Name of Secretary, with particular location of office.]

SEC. 8. Said last named notice shall state every certificate of stock with the number of shares which it represents, and the amount due thereon, separately, except where certificates may not have been issued to parties entitled thereto, in which case the number of shares and amount due thereon, together with the fact that the certificates for such shares have not been issued, shall be stated.

SEC. 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale. The first publication of all delinquent sales shall be at least fifteen days prior to the day of sale.

SEC. 10. By the publication of the said notices, as hereinbefore provided, the corporation shall acquire jurisdiction to sell and convey a full, complete, perfect, and absolute title to all of the stock described in the notice of sale upon which any portion of the assessment or costs of advertising shall remain unpaid at the hour appointed for the sale, but shall sell no more of such stock than is necessary to pay the assessments due and costs of sale.

SEC. 11. On the day and at the place, and as nearly as may be at the hour appointed in the notice of sale, the Secretary, who is hereby fully empowered and authorized, shall, unless otherwise ordered by the Board of Trustees, sell, or cause to be sold at public auction, to the highest bidder for cash, so many shares of each parcel of said described stock as may be necessary to pay the assessment and charges thereon, according to the terms of said notice of sale; *provided*, that if payment be made before the time fixed for sale, the party paying shall only be required to pay the actual cost of advertising.

SEC. 12. The person offering at such sale to pay the assessment and costs for the smallest number of shares, or fraction of a share, shall be deemed the highest bidder.

SEC. 13. If, at the sale of any stock under the foregoing provisions of this Act, no bidder shall offer to take and purchase the same for the amount of the assessments, and costs and charges then due upon the same, then and in such case the same may be purchased and bid in by the company or corporation, through the Secretary or President, or any Director or Trustee thereof, at a sum equal to the amount of the assessments, costs, and charges due upon the same; and in pursuance and by virtue of such purchase, the said assessments, costs and charges, shall be credited, as satisfied and paid in full, on the books of such corporation, and entry of the transfer of such stock to such corporation, in pursuance of such sale and purchase, shall be made on the books of said corporation. While such stock shall remain the property of such corporation, the same shall not be assessable, nor shall any dividends be declared upon the same; but all assessments and dividends shall be apportioned upon and against the other stock of such company not owned by such corporation. All purchases of its own stock made by such corporation, in accordance with the provisions of this section, shall be held valid, and as vesting the legal title to the same in said corporation; and the stock so purchased shall be held subject to the control of the remaining stockholders, who may make such disposition of the same as they may deem fit, in accordance with the by-laws of the corporation, or vote of a majority of all the remaining shares. Whenever any portion of the capital stock of any corporation is held by the said incorporation by purchase as aforesaid, a majority of the remaining shares of stock in said corporation shall be held to be a majority of the shares of the stock in said corporate company for all purposes of election or voting on any question before a stockholder's meeting.

SEC. 14. The times or dates fixed in any notice of assessment or notice of delinquent sale, published according to the provisions of this act, may be once extended for a period of not more than thirty days, by order of the Board of Trustees, duly made and entered on the records of the corporation, but no order for extending the time for the performance of any act specified in any notice shall be effectual unless notice of such extension or postponement be appended to and published with the notice to which [the] order relates.

SEC. 15. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the non-performance of any act required to be performed in order to enforce the payment of the same, but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

SEC. 16. No action shall be sustained to recover any stock, or invalidate the sale of any stock for delinquent assessments, upon the ground of any irregularity in making the assessment, or for any irregularity in or defect of the notice of such sale, or for any defect or irregularity in the sale, unless the party seeking to maintain such action shall first pay or tender to the corporation or the party holding such stock so sold, the sum for which the same was sold, together with all subsequent assessments which may have been paid thereon, and interest on such sums from the time they were paid; and no such action shall be sustained unless the same shall be commenced by the filing of a complaint and the issuance of a summons, thereon within six months after such sale shall have been made.

SEC. 17. "An Act Concerning Assessments upon the Stock of Corporations," approved April 4th, 1864, and all Acts and parts of Acts, inconsistent with the provisions of this Act, are hereby repealed; *provided*, that such repeal shall not affect proceedings commenced for the collection of assessments heretofore levied, but all such assessments may be collected in accordance with the provisions of the laws then in force.

SEC. 18. This Act shall take effect immediately.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, July 3, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.		Per ton.
12 per cent. ore	$16 00	22 per cent. ore	$43 56
13 " "	18 82	23 " "	46 45
14 " "	20 20	24 " "	49 33
15 " "	23 35	25 " "	52 22
16 " "	26 23	26 " "	55 11
17 " "	29 12	27 " "	58 00
18 " "	29 91	28 " "	60 80
19 " "	34 90	29 " "	63 77
20 " "	37 78	30 " "	66 66
21 " "	40 67	31 " "	69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, June 27th: Timber and lumber for the Monitor mill, are assuming shape, and the buildings will in a few weeks be ready to receive the machinery, much of which is now on the ground.

Mr. Thompson has commenced work on the Pittsburg mill, recently purchased for the Pittsburg Co., preparatory to setting the stamps in motion on quartz now accumulating up the cañon.

Mr. Begon, the gentleman connected with the Rivot process, left for Nevada County Thursday morning, taking with him samples of 50 and 100 lbs. each from the Tarshish, I. X. L., Morning Star, Lady Franklin, Leviathan, Buckeye No. 2, Congress, Balaklava and Pennsylvania, which he will thoroughly test by this process and report progress here.

The Pittsburg Co. this week have had a survey of their I. X. L. lode, to determine whether a certain extension is on it or not. The mine is improving at all points.

The workmen on the Globe tunnel were this week taken from the old works and started on the new.

Chronicle, June 27th: Quite a body of water has been struck this week in the Rippon tunnel.

J. A. Thompson has taken possession of the Whiteside mill, lately purchased by the Pittsburg Co. It will be run on I. X. L. ore. Hereafter the mill will be known as the Pittsburg mill.

Calaveras County.

Chronicle, July 4th: A San Andreas correspondent writes that the great need of that locality is a custom mill, so that miners may test the quality of their ore at reasonable rates.

Kern County.

Havilah *Courier*, June 27th: J. C. Birdseye has purchased two-fifths of the Esperanza mine, near Sageland.

From a run on 25 tons of rock from the Delphi mine, the sum of $2,000 was cleaned up.

From Long Tom we have the following items: On every hand we hear of the success of prospectors in exploring our county, and of the prosperity of those who engage in developing the mines and working the mills. The Gould & Curry mine at that place is worked by Joseph Woodworth. For some time past he has put means into operation to develop the mine, and has thoroughly tested the ore, and from the product of the mill, which has been working for some time, all are fully convinced that it pays exceedingly well. The mine yields great quantities of rich ore. The gold is confined principally to the sulphurets, which is the proto-sulphuret of iron, and is worth $125 to the ton. There is also present the bi-sulphuret, but it does not yield much gold, the proto-sulphuret being altogether the most valuable.

Los Angeles County.

Los Angeles *Star*, July 4th: Miners are at work now on the Temescal tin mines, in order to test as to the existense of ore, its quality, quantity, etc. Should the result prove satisfactory, capital will be invested to work the mines in a thorough manner.

Nevada County.

Transcript, July 2d: Frank Fisher has just finished an 8-stamp mill for Palmer & Everingham, and it will be shipped to Enreka to-day. The old engine and machinery have been remodeled and fitted up, so that it is as good as new.

July 7th: The ditch property and mining claims at Little York, known as the Gardner property, was yesterday sold to Atkins, Cozzens and Squire for $30,000. This property is extensive and valuable for the gold it contains.

Last Monday, at the North Star mine, the richest body of rock ever taken out was found. The quartz was full of free gold, and must have yielded enormously.

Gazette, July 2d: We saw at J. J. Ott's assay office yesterday a bar of gold weighing 286 ounces, and worth $5,000. It was melted by Charles Dunn, of Ott's assay office.

July 6th: Kinder & White, on Bear River, above Lowell Hill, are running a tunnel for the purpose of putting off a blast of 200 kegs of powder.

Grass Valley *National*, June 29th: About 30 loads of rock from the Dromedary mine, on Echo Hill, are being crushed at the Gold Hill mill. It will average from $30 to $50 per load.

July 3d: Ben. McCauley's mill turned out yesterday $5,120 from 160 loads of rock from the Idaho. This is exclusive of the sulphurets, and gives an average of $32 per ton.

Grass Valley *Union*, June 30th: Yesterday the first clean up of the Mutual Gold Mining Co's mill was brought to town, and after melting turned out a nice little bar of gold, weighing 175 ounces. The Mutual's claims are on the Jim ledge, of the Graniteville district. This crushing comes from 160 tons of rock, and the cost of taking out, milling and all other expenses, will not amount to over $5 per ton, which leaves a handsome profit to the owners of the mine.

The American Mining Co., on Manzanita Hill, near North San Juan, are still buying up the ground in their vicinity, for mining purposes.

The North Star Co., at the French Lead, is still going down, and as they descend are striking it richer than ever. Yesterday about $2,000 in rich specimen rock were taken out of the sixth level, west, and it is expected that more of the same sort will be raised to the surface within a day or two.

On the Greenhorn ledge, 300 tons of poor rock are now on top of the ground, and a company has leased the ledge, preparatory to putting a mill upon it. Yesterday a crushing of ten loads of the rock from the top, which has been on the surface for two or three years, was made at Laton's mill in this place, which resulted in $12 per ton.

July 1st: The mill at the Empire is now running day and night on splendid rock. The mine shows well, the smallest part of the ledge being two feet in thickness, and in the bottom of the shaft is three feet. The sixth level is going into the Rush & Laton ground, 550 feet south of the new incline. This gives good ground for 1,000 feet in length and 160 feet deep, and also gives an additional 55 feet down for another level. The Empire will, from this on, run night and day, with the increased facilities for taking out ore.

July 4th: The Mutual Mining Co., of this place, engaged in working the Jim ledge at Eureka, have just completed a contract for working their mine—the contractors agreeing to mine and mill the quartz at $5 per ton.

EXCELSIOR.—*Transcript*, July 8th: Mr. Figniere, recently from Meadow Lake, gives us the following items from that locality: Several companies are preparing for work, and by the middle of the mouth a number of mines will be in operation. The snow now is an advantage to miners, as it facilitates travel and hauling from point to point.

A company was organized on the 12th of January, to work the Independence ledge, and work was commenced immediately. After going down with a shaft 80 feet, they found a well-defined ledge seven feet wide. The rock is of a dark, rusty appearance, and sparkles with flakes of pure gold. It is said to be the most promising prospect ever obtained in the district.

The Enterprise Co. commenced work on Monday last. This company has built two furnaces, one for the purpose of roasting rock, and the other for treating sulphurets. This ore has yielded immense assays, but the ore has proved refractory, and they have not succeeded by the ordinary mill process in making it pay. Should the treatment now about being tested prove a success, the mine will come out all right.

The Green Emigrant Co. is taking out first-rate rock, which is to be crushed at the California mill. The ledge is about six feet wide and the rock is easily obtained. The last crushing paid from $25 to $30 per ton in free gold.

The Empire Co. are also at work, taking out fine looking specimen rock from the shaft, which is 30 feet down. They will soon have a crushing at the California mill.

The Lake Co. has a ledge 3½ feet wide, and the rock assays $349 in gold and $11 in silver. They have an incline 30 ft. deep, and only waiting for water to go down to resume work.

The Grant Co. have a fine ledge and first grade rock. The ledge has been worked more than any other company in the District, except the Mohawk. They will build a large mill this summer.

The prospects in the District were never better, even in the days of greatest excitement, and the miners are confident that it will prove a fine quartz region.

Placer County.

Auburn *Herald*, July 4th: The mining excitement in this vicinity is about as usual. The Rising Sun Co. continues to clean up weekly, with its 5-stamp mill—the yield last week being $2,500. The Montana Co. are at work, and upon the completion of the drift from their shaft, they are confident of striking it big. A number of other companies are also at work, and a recent discovery by Mike Curley is believed to be very rich. It is the opinion that a proper development of these mines will give us as good a mining district as there is in the State.

Plumas County.

Quincy *National*, June 26th: A correspondent writing from Poorman's Creek, gives us the following items from that locality: The Washington Hill boys are doing well. The American Co., of 12 men, are making from $7 to $8 per day to the hand, with plenty of ground to work. Bill Black, in the Washington claims, joining the American Co., is also doing well and making money....Sawpit Flat will be a lively camp this spring, as all expect good pay as soon as they finish washing up their winter's dirt. One interest sold in the Buckeye tunnel, a few days ago, for $3,800. ....I saw an assay that was had at Marysville, of some quartz from Poormans' which assayed $49 per ton.

Sierra County.

Downieville *Messenger*, July 4th: The Docile mill has again been started on very rich rock....The owners of the Bush Creek mine are erecting a mill 90 by 40 feet, with a capacity of 30 stamps. The frame is up, and being enclosed as rapidly as possible. The shaft is down about 230 feet, and the richest kind of rock is found in the bottom. They will start with 10 stamps and increase them as occasion demands....Nicholas Berets, owner of the Kearsarge ledge, an extension of the Union, at Alleghany, is going forward on it, with every indication of having an excellent mine.

The owners of the Union quartz claim are taking out very rich rock, and have already started their mill. If the run is satisfactory, they will immediately erect steam hoisting works.

Mr. Gardner has sold a one-half interest in the Johnson claim, near the Docile, for $8,000. The ledge has been prospected for about 400 feet, and discloses the richest kind of rock.

Manson & Co., of the Downieville Foundry, have taken a contract to build an 8-stamp quartz mill for the French Co's ledge, on Wolf Creek. This ledge is believed to be very rich.

Last week rock was struck in the Phoenix claims above Sierra City, which paid $1 to the pound.

The editor having visited Goodyear's Bar, states that the miners engaged in the river diggings are doing remarkably well, considering the high stage of water in the stream. The Chinese Co's claim has been paying well during the past two months, and a large tract of rich ground still remains to be worked. The treasure leads along the side of the creek are in process of development. The claims at Cox's Bar are paying well as usual.

The Hunter Quartz Ledge, below Alleghany, has a tunnel into the ledge, tapping it 150 feet below the surface. The ledge is only from one to three feet wide, but is rich in free gold and sulphurets. The company are now running on the ledge each way from the tunnel.

Siskiyou County.

Yreka *Union*, June 20th; Mr. Klimper, of the South Fork of Humbug, took out of his claim last week, for one man drifting, $120. In this there was one piece weighing 3½ ozs.

N. Lash has just made a run of 100 tons of quartz from the Eliza ledge. The yield is a little over $15 to the ton. The quartz is not so rich as some taken from other ledges, but the ledge is five or six ft. in thickness, while the ledges that have yielded the richer quartz are not over that many inches. We understand that remarkably fine rock is being taken, at present, from the Knapp ledge, owned by Lash, Laner & Co. Laner showed us some pieces of quartz taken from the ledge where it is being worked at present—about 200 ft. below the surface—which literally glittered with gold. The rock heretofore taken from this ledge has averaged over $50 to the ton, and that being taken out now has the appearance of being vastly richer than any taken out before. The prospects now are, that Humbug, in a few years, will be one of the richest and most prosperous quartz districts in the State.

Sacramento County.

Bee, July 7th: The Dozier Metallurgical Co. have filed their articles of incorporation. Capital stock, from $100,000 to $150,000.

Tulare County.

Visalia *Delta*, July 1st; Business in this mining district is quite brisk. Several ledges hitherto supposed to be of no value have proved rich. The Long Tom Co. have opened their mine at a point north of the old shaft. The lead develops fine and pays well. Messrs. Bell & Co. also are taking out rich ore.

Journal, July 4th: Henry Potter & Co. have finally found an ounce a day to the hand in their claims on Egan's Bar, half a mile below Junction City.

Jacob Hager and Fred. Haas, present owners of the Fegan claims, at Junction City, have purchased of Jeremiah Dacy the mining claims adjoining their property, and the right to all the water heretofore claimed by him.

Tuolumne County.

Sonora *Democrat*, July 4th: The Knox and Boyle mine at Quartz Mountain is paying well. The rock will average $30 per ton, and is easily mined. The last run of 57 tons paid over 100 ozs.

A few days ago, Mr. John Mooney showed us a very rich specimen of rock from his mine on the south end of Whiskey Hill, near Jamestown.

We recently paid a visit to App's mill, and found Mr. App, one of the proprietors, cleaning up some amalgam. He informed us that the mill has been running for the last 11 years. The rock is hauled from the mine at Quartz Mountain, a mile distant. The rock pays from $20 to $25 per ton, but Mr. App says that they cannot save more than half of the gold. The tailings, after being oxidized by a year's exposure to the sun and air, pays better than the rock at the first crushing; $16 per ton is the average yield of them, but the great trouble is that there is no place to save them at the mill.

Work is going on at Kincaid's Flat tunnel with great regularity. They will tap the Flat nearly 40 ft. deeper than any of the miners have yet reached. The dirt at the deepest point is found to be very rich.

Yuba County.

Marysville *Appeal*, July 1st: The Board of Trustees of the Pennsylvania Co. have decided to borrow the sum of $8,000, and mortgage their property, for the purpose of paying off their hands and getting rid at once of their indebtedness. This will leave the company sufficient time to take out this amount from their mine, or to raise it by small assessments.

ARIZONA.

Prescott *Miner*, June 13th: The rock now being taken out of the Chase mine looks well. The mill is running.

The Enreka 10-stamp mill, Walker's district, has been rented by Henry W. Fleury, of this place, and men are now engaged in putting it in running order.

Work on the silver ledges in the new district east of the Hassayampa, between Wickenburg and Walnut Grove, is progressing, and the lodes are looking well.

A prospecting party left Prescott one day last week, for the Hacquihala Mountains They intend to be gone about three weeks.

COLORADO.

Herald, June 17th: F. H. Conant is running six stamps of the Holman mill on ore from the Bates, and six stamps on ore from the Adaline lode....Mr. Fitzpatrick's new 12-stamper was started up on Monday last. It is one of the finest running mills in the Territory....The shipments from the Central City Banks this week are as follows: Warren Hussey & Co., $11,500; George T. Clark & Co., $11,375; Rocky Mountain National Bank, $11,500....Write & Co.'s claim, South Clear Creek, turned out 51 ozs. of gold last week....The Smith & Parmelee Gold Mining Co. shipped 128½ ozs. of gold this week. Valuable improvements have recently been made in the mine. ....We saw a lot of beautiful gulch gold at Warren Hussey & Co.'s this morning, which weighs 43 ozs., and was taken from Pleasant Valley by Owens & Queen. They have about as much more to clean up now.

Charles Havens, of Black Hawk, is raising a very fine appearing quality of ore from his silver mine, Mountain House District. It looks well and prospects very rich....Peter Rhu's arastra, at Enreka, is running night and day. The results, thus far, have been satisfactory. It is being run on surface quartz and mill tailings....Prof. Dibben is making arrangements for working his mines in East Argentine.....John Winders & Co. have put a string of sluices into Shot Gun Gulch, and have commenced ground sluicing....Mr. Jonson, of Black Hawk, is running the Cullison water mill, Missouri City, on surface quartz from a lode in Lake District, with very flattering results. ....E. R. Moss and Lem. Bradley have lately made the discovery of a new lode on Running Lode Mountain, Enterprise District. They have reached a depth of 30 ft., and have a fine vein of ore in sight.... Enos K. Baxter has resumed work on the Wilbur lode, north of the Adaline. He has reached a depth of 100 feet, and is raising a very nice lot of ore....The Wright mill, 18 stamps, Nevada Gulch, is being run by Hunt & Leighton. At present they are running one battery, on ore from the Golden Eagle lode, Lake Gulch District. The other two batteries are being run on ore from a lode at the head of Nevada Gulch.

Central City *Register*, June 18th: Miller & Co., working on the Bates-Hunter lode, have had 2½ cords crushed in a stamp mill, which yielded them 47 ounces of bullion, and sold for $940.... We saw at Idaho, a few days ago, three pounds of very clean gold, taken out the past week in that vicinity. Wright, Clenfield & Co. cleaned up 24 ozs. from four days work, by six men.... Hobbs & Needham's claim, on Grass Valley Bar, is looking well and prospects fair.... Wright, Clenfield & Co. are making big pay—took out over six ounces on Tuesday forenoon....Jere Lee & Co. are getting some pay, and their claim is gradually improving....Joe. Kenyon will resume operations in his reduction works below Black Hawk, next week....The gold shipments yesterday were $35,000 currency value. ....Work on Uncle Hurd's mill is progressing finely....Hueneden, Walters & Co., shipped yesterday by Wells, Fargo & Co., to H. Amy & Co., of New York, two bars, viz.: Bar No. 83, out of Terrible and Sonora ore, $473.54 in coin. Weight, 605.40 ounces. Bar No. 85, out of Equator ore, $431.95 in coin. Weight, 475.25 ounces. Bar No. 84, weighing 64.85 ounces, coin value; $50.19 was custom work out of 1,500 pounds of Democrat ore.

The Oro City correspondent of the Denver *News*, gives the following items from the Arkansas mine: Long & Hemp are putting up a new hydraulic in Iowa gulch, and will be ready for work by the 15th of this month.

Burt & Co. hope to be well at work by the 20th.

Caruth & Hilton have just cleaned up—one of the finest of the season.

Ingersoll & Lambkin are at work in Tennessee Gulch, as are Barnard & Studt, in Buckeye Gulch.

No work has been done in Evans Gulch this season.

A large amount of prospecting is being done for lodes, for the most part near the head of California Gulch, and the success attending it is wonderful.

DACOTAH.

Sweetwater Mines, June 17th: While recently in Roberts' Gulch, we saw Mr. Roberts prospect a pan of dirt taken out from among the grass roots in the gulch, which gave between 20 and 25 beautiful colors.

P. A. Gallagher left yesterday for Salt Lake City, carrying $15,000 in gold dust, the proceeds of our much abused placer claims. This makes over $20,000 shipped this week, and yet but few claims have so far been opened.

Frank McGovern gives us the following items from Spring Gulch: At the lower claim with one sluice worked by three men they took out on the 6th inst., $96, on the 9th, $122, and on the 10th, $128. At the upper claim working a "Tom," with one man shoveling and one tending sluice, they have averaged $40 a day, right along.

Near the Mineral Star ledge, in Mill district, a company headed by Lewis Lund, have commenced operations in good earnest. They have turned the creek, and with one sluice box, have, in one half hour's work, taken out enough to justify them in believing they have $25 a day diggings.

IDAHO.

Owyhee *Avalanche*, June 20th: Jim Allison has struck good hill diggings below Boonville, in the vicinity of Blue Gulch. A good paying prospect is found in the gravel three ft. from the bedrock. We believe that rich placer diggings will be found hereabouts in localities that, as yet, people have never thought of prospecting.

It is reported that rich placer diggings have recently been struck two miles below Wagontown.

Boise *World*, July 1st: We have the following items from Deadwood Basin: There are now employed in the Basin about 130 miners, and the diggings yield from good wages to very rich pay. Water holds out better than the miners expected it would, and has afforded them a longer season of labor than was anticipated....The Dutch Co. claims have paid exceedingly rich—fully $100 per day—during the season, but want of water has caused temporary suspension of the work.

The claims taken in the Payette River promise to yield richly. In a month or two it is expected the river will be sufficiently low to commence mining in it. A good deal of prospecting has lately been performed along Bummer Creek, which courses through the center of the Basin. The ground prospects well all the way, and in no instance has the bed rock yet been reached. The average richness of the ground and the unusual depth of these new diggings, give bright promise of very excellent mining in all the claims in this locality.

The quartz ledge discovered some weeks ago in the Basin continues to prospect better and richer as it is worked. A shaft of 20 feet is sunk into the ledge, and the rock reveals much wealth of gold all the way down. A good amount of this rich ore is now waiting the rude crushing process which the owners can at present apply, but the rock will pay at that.

MONTANA.

Helena *Post*, June 10th: Young & Bivins in the Little Prickly Pear bottom have sunk their shaft 40 ft. and find a color of gold throughout the greater portion of it.

We yesterday saw in the First National Bank building, three bars of gold weighing respectively 404 ozs., 351 ozs. and 66 ozs., the total value of which was $24,606 in gold coin, or nearly $35,000 in currency.

Keating & Co., at Jefferson Gulch, are making, regularly, one ounce per day to the man. The last clean up of Darah, Harris & Co. was 50 ozs. A new gulch, supposed to pay well, has been struck on Willow Creek.

Work will be suspended on the Whitlatch Union lode for a few days while steam pumps are being put in the mine. The quantity of water now in the mine necessitates the introduction of pumps.

Thus far the Yellowstone party have failed to accomplish the object of the expedition. It is supposed that they will make a new start soon.

The new diggings at Crow Creek are said to be fully as good as at first reported.

H. Clark & Co., at Norwegian Gulch, are running a bedrock flume and ground sluicing near the cañon. Alexander & Co. have completed their drain ditch and are doing well, making from $8 to $15 a day to the hand. David Hopkins, John Wynant & Co. have 1,500 ft. of flume completed and are making from $10 to $18 a day to the hand. Vanderbilt, Glasgow, McArthur & Co. are running a drain ditch and expect to have it completed in about two weeks. The claim of Cagee & Co. is paying well. On last Thursday they cleaned up $68 and took out a $20 nugget. On Friday they cleaned up $96, an $8.50 nugget being included. On Saturday their clean up was $114, with a $25 nugget. The gulches tributary to Norwegian and lying in the vicinity are paying well. Oro Fino Gulch, on North Willow Creek, is paying an ounce per day to the hand. A new gulch was discovered week before last on South Willow Creek, which, it is supposed will give good results.

New and rich quartz discoveries are reported on the Georgetown side of the Cable Mountain and within 1¼ miles of the Cable lead.

At Wilson Creek water is plenty. Seven claims have been staked for discovery, 36 claims above discovery and 56 below. Prospects have been obtained from one to 25 cents to the pan....New diggings have been found between this place and Prickly Pear at a point about two miles below discovery. ....A new flume to replace Hillis' flume, which was recently washed away, is being built at Diamond City at a cost of over $1,500....The ditch which drained the celebrated rich claims in Confederate Gulch is believed to have become entirely filled up, so that a new drain will have to be dug. ....A small dry gulch, called Granite Gulch, and said to be quite rich, has been discovered in the vicinity of the Gold Creek diggings....The hydraulic claim of McChord & Co. at Red Mountain City is yielding at the rate of $1,000 per day....Considerable work on hills and bars is being done at Indian Creek with good results.... Prof. Swallow's quartz mill is now on its way to Highland.....The Snow Shoe mines are yielding better than was expected in the early spring. A narrow channel was recently struck, which bids fair to prove rich. Eight companies are at work there.

NEVADA.

Esmeralda.

Aurora *Union*, June 27th: The Baldwin Mining district, on the western shore of Walker Lake, has been attracting considerable notice among our citizens of late, and returned prospectors report very favorable. Dr. Mason says that there is no foolishness about the richness of the ore, only as the Jew said about the money: "it is very good, only there is not enough of it." Some parties from Virginia are building a furnace and burning charcoal, and manifest confidence in the mines.

Humboldt.

Unionville *Register*, June 27th: On Friday, Gov. Fall commenced hauling ore to the new mill, and intends to pile up a large quantity preparatory to doing an extensive business as soon as the mill commences work....Fall & Co. shipped this week per Wells, Fargo & Co's Express, 2,100 ozs. of fine bullion....During the early part of this week, the miners on the Monroe struck into a deposit or pocket of ore that shows at least $60,000 in gold. This being outside of, and independent of, the legitimate streak of pay ore, makes it a property of great value....The Arizona mine is improving both in size and richness every foot that that is gained upon it in depth. It is strong five feet wide, and pays $100 to the ton from wall to wall without roasting. The new mill will start up next week....We are informed that James Hendra has made a handsome strike in the Do Soto mine, Star district.

From the same, July 4th: The reports from Battle Mountain are more encouraging than at first. The Little Giant ledge has not been over estimated, either in point of richness or quantity of ore. The owners have contracted to haul 30 tons of ore to the Negus mill, which is confidently expected to pay $200 to the ton. A correspondent writes: The last ore we worked from the Little Giant ledge paid $192 per ton. We have at the mill 22 tons that will pay equally as well, if not $50 per ton more. We are taking out ore steadily, but will not send any more so far to mill, as we expect Atchison to have his mill running within sixty days. Arrangements have been made with McBeth and Fox for a divided portion of the Little Giant Co's ground. E. J. Elzy has made arrangements with McBeth, Melander and Minor, for 300 feet on the south end of the Santa Clara Co's claim, on the Little Giant ledge, and will go to work immediately. The Monitor and Troy Co's are making preparations to commence work on the same ledge. Within 30 days there will be five companies at work on the Little Giant....Some very fine and valuable strikes have been made within the last ten days in the Cumberland and Register locations, in Gold Run district. On these two claims work is being prosecuted most vigorously. The first south Goleonda is looking very fine. The proceeds of the Goleonda mine, or rather of the mill, amount to from 250 to 300 pounds of bullion per week, of the value of from $10 to $13 per pound. ....The Arizona mine is developing extensive deposits of ore every day. The new mill will be at work next week, when Kyle & Co., who got the contract to haul ore, will have to move lively in order to keep the two mills running.

Reese River.

Austin *Reveille*, June 20th: Lundbom assayed yesterday a piece of ore from the Eberhardt South, in the district of White Pine, which gave the yield of $17,123 per ton. He smelted 2½ ozs. of the same ore, which yielded one and one-fifth ozs. of pure silver, or about 46 per cent

June 24th: In the level which has been run from the incline in the Belmont Co's claim on the El Dorado ledge, Silver Bend district, a body of rich sulphuret ore two ft. thick has been developed. The level is only 30 ft. below the surface. In the Arizona, which is believed to be an extension of the El Dorado, the developments continue to be good; and in the south incline of Antonio Borques' claim, at the depth of 50 ft., a rich stratum nearly two ft. thick has been disclosed near the hanging wall. A fair quantity of the ore had been brought to the surface, the estimate yield of which is high. L. Martin is working the claim known as the Vulcan and Arizona Consolidated with fine results, and is taking out considerable quantities of good ore for the mill. A claim called the Soila, lying between the Independence and the Arizona, and belonging to A. Borques, is also producing excellent milling ore. The Combination mill in working custom ore has produced the most beneficial results.

The Buckeye mine, in Summit Cañon, produces ore of fine quality. We were shown this morning a certificate of assay by Boalt & Stetefeldt of the pulp of 16 tons of the ore which have just been reduced at the Mettacom mill, the yield of which was $257.68 per ton. A former lot yielded nearly the same result.

June 26th: The mill of the Twin River Co. at Ophir Cañon, which was stopped several days for repairs, will be opened again after the Fourth. Workmen are sinking the incline shaft of the Murphy mine in order to open a level; and the mine is said to look remarkably well.

June 27th: To-day 83¼ ozs. of gold from Goose Creek were deposited in the office of Boalt & Stetefeldt, which, after melting, was worth $12.73 per oz.

June 29th: The amount of bullion produced by the Manhattan mill for the week ending the 27th inst., is 22,548 ozs.

A lot of 50 tons of ore from a mine in the Cortez district has been taken to the Mettacom mill for reduction, the yield of which will average unusually high.

July 1st: To-day 3 8-10ths lbs. of ore from the Keystone claim in the district of White Pine were deposited at the office of Boalt & Stetefeldt for assay and smelting, the yield of which is remarkable. The assay value of the pulp per ton is $10,747, or at the rate of $5.37 per pound; total value of the silver in the pulp, $20.41. The pulp was smelted without the addition of lead, and required only a flux to reduce the gangue, and it yielded a bar of silver .845 fine, and of the value of $18.07.

During the month of June there were shipped from the office of Wells, Fargo & Co. in this city, 234 bars of bullion, weighing 17,765 lbs., and valued at $253,207.42.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, July 2d: The total amount of bullion shipped from the office of Wells, Fargo & Co. in Gold Hill, during the month of June, was $505,523.05.

The total amount of bullion shipped from this city and Gold Hill during the past week was 14,516 pounds, worth $386,875.52, being an increase over the shipment of the previous week of 2,554 pounds and $98,996.77.

The mines in the new Truckee district are again attracting attention. These mines were deserted at the time the Meadow Lake excitement broke out, and little has been done with them since. An assay, which was made day before yesterday at E. Ruhling & Co's Gold Hill assay office, of an average specimen of argentiferous galena, from the Imperial Consolidated mine, yielded in silver at the rate of $169.80 per ton.

Gold Hill *News*, June 30th: There was shipped from Wells, Fargo & Co's office this morning, 18 sacks of bullion, weighing 1,438 pounds, and of the assayed value of $38,865.50.

An assessment of $25 per share is levied on the capital stock of the Alpha.

July 3d: There was shipped from Wells, Fargo & Co's Gold Hill office this morning 26 sacks of bullion, weighing 2,100 pounds, and of the assayed value of $52,061.13.

NEW MEXICO.

A correspondent writes to the Santa Fe (N. M.) *Gazette*, of June 20th, concerning the Cimarron mines as follows: A new era will commence for these mines when water is introduced in sufficient quantities. There are miles of ground, known to be rich in gold, which now lay idle for want of water, which will then yield untold amounts of the precious metal. The hight to which the water is to be carried is almost incredible, and the area that can be watered from it, about 25 square miles, all gold-producing, enough to employ thousands of men for a generation. The claims of the Colorado Co. and Waller & Co. average $1,000 per week; O'Brien's, $700, and other claims, the names of which I do not now recollect, the same. On the 30th of May I bought from the Leavenworth Co. 44¼ ounces of gold, the result of one week's work for five men; yet this company only get water to work their sluices every alternate night and every second Sunday....A discovery of a quartz lead has been made within the last few days, some miles east of here, on Ute Creek. The discoverers' names are Robert Doherty, a soldier discharged from Captain Thayer's Company of California Volunteers, and Tim. Foley. They describe the lead about six feet wide, and say it can be traced for over 2,000 feet on the ground. Doherty showed me a specimen of the quartz. It is certainly the richest specimen I ever saw.

Denver *News*, June 10th: We have seen samples of copper ore from the Cimarron, richer than the copper mat made at the Mountain Smelting Works—looks just like it, same color and texture, and full of globules of metallic copper, probably 75 per cent. copper.

OREGON.

Jacksonville *Sentinel*, June 20th: Muller, of the firm of Muller & Brentano, has purchased the Ballou lead; consideration not given.

The last run of rock crushed at the Occidental, from the Ballou lead, yielded $11.50 per ton. There is plenty of rock in sight, and the indications are that it will increase in richness.

June 27th: Fox, Patty & Co., who were running a tunnel in the hill facing Allen's Gulch, in Josephine County, send us word that they have struck the channel and with it rich pay, there being a very large bed of gravel, which prospects three bits to the pan.

Salem *Record*, June 25th: The Salmon party, who have been working the Santiam quartz mines, have at last become discouraged, and "thrown up the sponge." They could only average $3 per ton, and $5 was the least amount that would pay for working it. [The community seems to be greatly disgusted with the entire operation, especially those whose funds have been used to develop those "curious" spiral auriferous formations.—Eds. Press.]

Mining and Scientific Press.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

San Francisco:
Saturday Morning, July 11, 1868

Notices to Correspondents.

A FRIEND OF EDUCATION, in a lengthy epistle, dwelling largely on the subject of the future conduct of our State University, calls attention to an appropriate passage from the celebrated Lord Bacon, which he trusts will be kept in view by the Regents, as applicable to the selection of the various Professors, and especially the President, in order that such views may be carefully impressed on the students. "He who would come duly prepared, and fitted to the business of interpretation, must neither be a follower of novelty, custom, nor antiquity; nor indulge himself in a liberty of contradicting, nor servilely follow authority. He must be neither hasty in affirming, nor loose and skeptical in doubting; but raise up particulars to the place assigned them by their degree of evidence and proof. His hope must encourage him to labor, and not to rest; he must not judge of things by their uncommon nature, their difficulty or their high character, but by their just weight and use. He must in his own particular, carry on his view with concealment, and yet have a due regard for posterity. He must prudently observe the first entrance of errors into truths, and of truths into errors, without despising or admiring anything. He must understand his own talents and abilities, or the advantages of his own nature. He must comply with the nature of others. He must, as with one eye, survey the nature of things, and have the other turned towards human uses. He must distinctly understand the mixed nature of words, which is extremely capable of both prejudicing and assisting. He must lay it down to himself, that the art of discovering will grow up and improve along with discoveries themselves. He must not be vain either in delivering or concealing the knowledge he has acquired; but ingenuous and prudent, and communicate his inventions without pride or ill-nature; and this in a strong and lively manner, well defended against the injuries of time, and fit for the propagation of knowledge, without occasioning errors; and which is the principal thing of all, it must be such as may select and choose for itself a prepared and suitable reader."

A CURIOUS MINERAL has been received from a gentleman whose name we neglected to obtain, said to be found in Napa County, about three miles west of St. Helena, and to occur in a regular vein of some four feet in width, inclosed between walls of sandstone. This mineral very much resembles shorl, and is somewhat identified, in its physical aspect, with spheno or pitch blende; but does not exactly assimilate with any of the minerals named. The mineral may possibly be new, but a correct conclusion can be arrived at only by a complete analysis. We shall hold it for further examination.

COMMUNICATION from our traveling correspondent, "B," received, and will appear next week. Box of specimens also received.

THE NEW PRODUCE EXCHANGE, in Hayward's building, on California street, was opened with appropriate ceremonies on Monday last. The necessity for such a convenience has long been felt in this city, where the produce business is forming such a large portion of our trade.

The Projected Darien Ship Canal.

A correspondent asks if there is anything now in progress with regard to the Darien Canal project; and what has been done since the survey undertaken in 1853, by the Atlantic and Pacific Junction Company, assisted by the British, French and American vessels-of war. Thinking that this matter might be of sufficient general interest to warrant a more extended answer to queries in our columns of "Notices to Correspondents," we here append a brief resume of this important work.

What was a few years ago considered the mere dream of mere enthusiasts, is now more than probable. The result of recent explorations renders it very likely that there are now living those who will see the richly laden ships from the Indies pass across the Isthmus of Darien on their way to the ports of Eastern North America and Western Europe. The idea of a ship canal across this isthmus has been entertained almost from the earliest settlement of America; it was favorably spoken of by Humboldt in his early travels on this continent, and by almost every engineer who has ever closely examined into its practicability.

The Isthmus itself presents no serious obstacles to engineering skill; nearly the whole extent of numerous passes between the two oceans is made up of hills and plains. The highest point where the railroad crosses is only 280 feet above the level of the sea, and the earth from nearly all the excavations required for a canal would be needed in constructing embankments across swamps and other lowlands. Careful observations made by Col. Totten, at the two termini of the railroad, have shown that there is no material variation of average levels between the two oceans—the observations show that the mean level of the Pacific is only 0.449th of a foot higher than the Atlantic. The only appreciable variation is the difference in time of high and low tides on the opposite shores. That is simply a regular oscillation—sometimes the one and sometimes the other ocean being the higher, except at mid-tide, when both are on a level. The few locks which would be required for a canal would effectually prevent any inconvenience from such a cause. The tides on the Pacific are much higher than that on the Atlantic; the average of the former being about thirteen feet, while those of the latter are a little short of one and a half feet. The constancy of the water upon the Atlantic is probably due to the local configuration of the coast; possibly the diurnal motion of the earth may have something to do with it.

No less than *nineteen* routes for canals, and seven for railroads, have been proposed, by any of which it is thought the Isthmus may be crossed. The latest governmental action in the matter was the passage of a resolution introduced into Congress by Mr. Conness, on the 10th of March, 1866, calling for information, through the Superintendent of the National Observatory at Washington, to be furnished the Secretary of the Navy, with regard to the "various lines for inter-oceanic canals and railroads between the Atlantic and Pacific oceans, especially as to the advantages of a ship canal." This action calls for all the information which had been collected on this subject up to that time. The information was given in a very full report by Admiral Davis, communicated to the Secretary of the Navy on the 12th of July following. This report gives a very full history of the explorations which had been made for crossing from the Atlantic to the Pacific by canals or railroads, and was accompanied by a series of maps, on the first of which each of the nineteen canal and seven railroad routes were distinctly laid down. This number includes the proposed routes across Tehauntepec, Honduras, Nicaragua and Panama, as well as across the Isthmus of Darien.

The report, keeping in view the prime object of the investigation—the practicability of a *ship canal*,—discusses but a few of these routes, further than is necessary to show their unfitness for the end in view. "It is to the Isthmus of Darien," says the report, "that we are to look for the solution of the great problem of an inter-oceanic canal. * * * On this Isthmus there are three routes which have never received the attention they merit: first, from the Chepo river to San Blas, or Mandorilla Bay; second, from the Gulf of San Miguel to the southern portion of the Gulf of Darien, or close to some point on the lower part of the Atrato." The first is but thirty miles across, but calls for a tunnel seven miles long. The second has spacious harbors on each side, but the information with regard to it is considered of a very doubtful nature. The third, which appears to be in part connected with the second, is favorably referred to, and efforts, we believe, were undertaken as late as February, 1867, under the auspices of Senator Sprague, of Rhode Island, to secure a reconnoissance of it, with the aid of a national vessel.

The Congress of New Grenada, in the latter part of 1866, passed an Act fixing the terms of a contract for a canal, to be offered to the public in London, and to be assigned to the highest bidder. We are not aware whether any special attempt has been made to take advantage of this offer. It is hardly supposable that the weak resources of this government will hold her back from any tempting offer which any responsible party might make for constructing this proposed work.

The above statements, we believe, fully answer the queries of our correspondent; yet the question is one of great magnitude, and deserving of still further consideration, which we propose to give at our earliest leisure.

OUR NEW MINISTER TO CHINA, J. Ross BROWNE, late Commissioner of Mining Statistics, arrived in this city on Friday last, from New York. He will sail for China the third of August, in the new steamer Japan, which has just arrived to take her place in that line. Mr. Browne, though inexperienced in diplomatic ways, has nevertheless traveled sufficiently, and is sufficiently well informed generally, to readily make himself at home in any sphere. As a resident of California, he has made her needs and resources an especial study for two or three years past, and is therefore all the better fitted to represent this government in a country with which the citizens of the Pacific Coast are more intimately connected than with any other foreign power. Being a gentleman of large cosmopolitan experience, thoroughly imbued with the modern spirit of material progress, and having never been wedded to any of the political isms of the day, he is precisely the man to represent us at a court which is just awakening out of a Rip Van Winkle sleep of ages, and which needs the advice of some active go-ahead Young America to lead it forward and introduce it to the family of nations. That Mr. Browne will fully discharge the responsible duties which are about to devolve upon him, there can be no doubt. He goes to his post under the most favorable auspices, and carries with him the hearty good wishes of the people most intimately connected with the objects of his mission.

STEAM TO CALISTOGA.—The railroad from Suscol to Calistoga was opened, the entire distance, the past week. Passengers can now leave this city at three o'clock P. M., and arrive at Calistoga the same evening—thirty-eight miles by steamer and thirty-one by railroad. The through fare, as now established, is $5.50. This popular place of resort will be henceforth more sought for than ever before.

The Coming Fair.

Calls for space in the Pavilion still continue to be received by the Committee, and the demand exceeds the most sanguine expectations of the managers. Applications have been made for space outside of the building for windmills, etc. In the meantime, work in the construction of the pavilion is progressing most satisfactorily. As the structure gradually assumes its proper shape, much gratification is expressed by all parties with regard to its appearance, and to the convenience which it will afford exhibitors. We understand that the bills for material and construction, thus far, renders it certain that the entire cost will fall considerably below the lowest bid offered for its construction by contract—$31,500. Hence, the Directors will make a handsome saving to the Institute in voluntarily taking upon themselves the superintendence of the structure by days' work. It should be borne in mind that the highest ruling wages is paid, and eight hours labor, only, required for a day's work.

From present indications the exhibit of woolen and other manufactured goods will surprise even the most sanguine. The display which will be made in this line will be most astonishing for a city which, less than twenty years ago, consisted of merely a few hamlets, situated on the sea shore, at a point one of the most remote from civilization to be found on the globe.

Among the novelties not yet announced will be the exhibit of Messrs. Faulkner & Son, who have concluded to place in the pavilion one of their type-manufacturing machines. This will be a most interesting novelty to nearly every visitor at the Fair. The same firm will also enter one of their home-made hand presses, manufactured for them at the Golden Gate Foundry in this city.

A glass engine will also be exhibited, having glass boilers for making steam for the same. The dimensions of the cylinder of this engine will be two and a half inches by nine inches stroke. An exhibit of the curious action of steam in the usually hidden recesses of the boiler, steam-pipes and cylinder, will be both interesting and instructive.

Several of the "privileges" connected with the exhibition have been let. The soda privilege has been let to E. H. Willis & Co.; the cider privilege to C. W. Weston, of the Pacific Fruit Market. Some enterprising restaurant keeper might make a good thing by securing the restaurant privilege, offers for which are still open.

LABOR EXCHANGE.—During the month of June, 1,670 orders for laborers were received by the Secretary of the Labor Exchange, as follows: House carpenters, 187; farm hands, 193; laborers, 392; wood choppers, 75; blacksmiths, 40; boys, 39; bricklayers, 42; cabinet makers, 27; canvassers, 24; cooks, 63; lumbermen, 72; milkers, 34; miners, 53; house painters, 27; teamsters, 52; men and wives, 19; shoemakers, 11; wheelwrights, 12; clerks, 8; miscellaneous, 306. The orders filled during the month were only 1,238; showing a deficiency of laborers, of the kind wanted, to the extent of 432. Of the number employed, 324 were married, 914 single; 293 were American born, the balance foreign.

CAPT. WILLIAM HAYNIE, of Sacramento, is now feeding about a million of silkworms, and the *Bee* says he will sell from 800 to 1,000 ounces of eggs, most of which will go to Europe, where the California eggs are in great demand, as superior to the silkworm eggs of any other quarter of the globe.

THE PACIFIC ROLLING MILLS, at Potrero Point, are about ready to go into full operation. A portion of the rolls were started up the first of the present week, and we presume the entire works will be in full blast in a few days.

Improvements at the South End.

There seems to be considerable activity at the present time along the water front near the foot of Third street. This locality can no longer be called "South Beach;" it may be temporarily known as the "South End," until the growth of the city shall place it so near the center of business that we shall have to go still farther southward to find the South *End*. The "Beach" that, until within two or three years, has extended from near the marine hospital for nearly a mile around Rincon Point to Mission Bay, has now entirely disappeared, and not a vestige of it remains; its name has even disappeared from the street cars which were formerly known as the North and South Beach Cars. This entire beach is now covered with extensive wharves, piers, docks, warehouses, manufacturing establishments, and an innumerable number of less portentious structures. Such a wonderful transformation, in so short a period, is rarely met with in the growth of any city.

New branches of industry are constantly being started in this neighborhood, and enterprises already undertaken are largely increasing their facilities for business.

THE PACIFIC OIL WORKS

are putting up an additional building, larger than their present structure, which, when completed, will give them about three times the space they now occupy. This, we understand, has become necessary to meet the increasing demands of business. The new structure will be fitted up with machinery, which will be especially occupied in the manufacture of castor oil. The demand for linseed oil from this establishment calls for the constant occupation of their present machinery. It is pleasant to notice such evidences of prosperity in the inception of any of our manufacturing enterprises, and especially in one so intimately connected with the agricultural industry of the State.

NEW SAW AND PLANING MILLS.

The increasing demand for such articles used in building as can be prepared by the aid of machinery or at a saw and planing mill, is leading to the rapid multiplication of such establishments in different parts of the city. In addition to those heretofore noticed in this journal, another has recently been erected on Brannan street, between Third and Fourth, 40x120 feet on the ground, and three stories high. An addition is now being built to this, having a 20-foot front and the same depth.

Still another, and, if we are not mistaken, the largest in the city, is now being erected near Long Bridge, and extending from Berry to King streets. The buildings of this establishment cover an area of 200x240 feet, and are nearly ready for occupation. Workmen are already engaged in setting up portions of the machinery. The works will be driven by a Hicks' engine of 120-horse power, built at the Miners' Foundry. The principal structures are of wood; but the boilers and engine, which occupy the central portion of the area, are placed in a fire-proof building, so arranged that they will hardly be able to communicate fire to the balance of the works, or be liable to any serious injury should the surrounding works be destroyed by the devouring element. The boiler and engine will cost from thirty-five to forty thousand dollars. The success of this enterprise is already fully assured by extensive advance orders for windows, sash, doors, etc., which cannot be supplied at the establishments now in operation. Messrs. Metcalf & Bros. are the projectors and proprietors of these works.

THE SAMUELS WOOD PRESERVING COMPANY.

These extensive works, which we have already noticed as in progress, are located near by, but just beyond the planing mills. They occupy a lot outside of the Long Bridge and fronting upon that structure, near its crossing of Fourth street. This location gives them free access to an unobstructed water front, and abundance of room for handling any amount of material. The works were already for starting yesterday.

Impressions by Heat and Electricity.

Karsten obtained very distinct impressions by the action of heat in different ways. He placed a medal upon a glass plate, and submitted both to a gradually increasing heat, in a common stove, for a few minutes. When the plate was cooled, it generally showed a distinct impression of the medal, on being breathed upon. A similar trial with smooth metallic plates did not yield similar results. He found that when a medal was moderately heated over a flame and then brought in momentary contact with a polished metallic plate, a beautiful impression appeared, which could be fixed by the fumes of iodine or mercury. The best impressions were obtained when the medals were not burnished, or were slightly oxidized by contact with the atmosphere. In such cases good impressions were at once visible, without the application of fumes of any description.

IMPRESSIONS PRODUCED BY ELECTRICITY.

Electrical figures, which have been termed by a German chemist, Dr. Riess, electrical hauchfigaren (figures produced by breathing) have been obtained upon metallic plates in the following manner: A coin is placed upon a metallic plate properly supported, but not insulated. Sparks from an electrical machine are caused to strike upon the coin. After 100 turns of an electrical machine with a 20-inch disk, the plate shows no impression until breathed upon, when a most perfect and beautiful impression of the coin, in its most minute details, is distinctly seen, and beautifully variegated with iridiscent colors. Similar, but less distinctly defined impressions, are obtained by the use of the galvanic battery.

When these phenomena were first observed, various speculations were indulged in with regard to the manner in which impressions were fixed, and to what they were due. The discovery having no practical value, we presume it has pretty much passen out of miad; at least we have never seen the phenomena accounted for.

In reading over the account of these experiments, which were first made known by Karsten, some twelve years ago, in Poggendorff's Annals of Chemistry, it has occurred to us that the impressions are due to the transference of portions of the metallic substance of the coins to the glass, by the electric or galvanic currents.

It is well known that a powerful galvanic current, such as is employed in the production of the electric light, in passing over carbon points, carries with it minute portions of carbon. If a metallic plate is properly presented to the current, these particles of carbon (at least a portion of them) may be collected on the plate, in the form of beautiful crystals of carbon, possessing a diamond-like hardness. In fact the carbon is converted into black diamond, which may be employed in place of diamond dust wherewith to cut the precious diamonds. These crystals adhere to the metallic plate with much tenacity. In the production of the impressions above alluded to, why may we not reasonably suppose that the flow of under surface of the coin, carried with it portions of the metal and fixed it firmly upon the plate upon which the coin rested in the same electricity, passing from any point of the manner as the carbon is known to be carried over in the case cited? The extremo thinness of the covering film would naturally be brought out more distinctly by being "breathed upon," or by being subjected to the developing action of the fumes of iodine.

WILLAMETTE UNIVERSITY.—We have received the annual announcement of the Department of Medicine from this university for 1868-9. The third course of lectures of this institution will commence on the 4th day of November next, and continue four months. This is now a permanent and promising institution.

RAPID MAIL COMMUNICATION.—Our fellow citizen, Professor Rowlandson, being desirous of obtaining an early copy of the ninth volume of the transactions of the Royal Geological Society of Cornwall, which has been promised some time, recently wrote to the President of that body with the object of ascertaining when and where the same might be obtained. On the 6th instant he received a reply, dated June 10th, and bearing the Penzance post-mark of that date, and the London one of the 11th, from which city it must have been transmitted to Liverpool. The distance from Penzance to London is between 300 and 400 miles; from London to Liverpool upwards of 200,—or say a total of 600 miles of land carriage in England,—from whence to New York, something more than 2,000 miles of ocean travel had to be traversed; thence from New York to San Francisco 3,000 miles of land conveyance had to be made,—the whole distance of 5,600 miles being accomplished,—including stoppages at London, Liverpool and New York,—within tweaty-six days, or at an average rate of about ten miles per hour for the entire distance, including stoppages.

The reply of the Secretary of the Royal Cornwall Geological Society contains a paragraph to the effect that memoirs on the gold of Brazil, ou the silver of Chili, on the native copper of Lake Superior, and on the sulphur ores of Ireland, will speedily be published. This fact will probably interest some of our readers.

Agents in Colorado.

CENTRAL CITY.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN.—John A. Lafferty, Postmaster, is our agent in this place.

PERSONAL.—Wanted, by friends in England, information of Andrew Jackson Van Winkle and Peter W. Van Winkle. Address this office. 1v17-3m

---

WANTED—At this office, the postoffice address of Enraght Massey, late of Gold Hill, Nevada.

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Paint will not remove in five minutes. Whether a frightful Burn, a griping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.

G. H. MOORE, Inventor and Sole Proprietor, 652 Market street, San Francisco, Cal. 21v16-3m

---

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

Support Home Manufactures.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, - - - - Potrero, San Francisco.

Howard st, between Fremont and Beale, San Francisco.

Fine or Tubular **Boilers**, with plain circular or spiral courses. Upright Fine or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, hight of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v10tf

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

HOME MANUFACTURED HOSE.—Numerous trials have been made, within the past two years, to determine the best quality of hose for the use of the fire department of this city. Eastern-made hose has been repeatedly tested by the side of California-made, at times with varying success; but more recently with uniform results in favor of the California-made article. Experiments have also been made with three-ply rubber hose; which, after three months trial, has been utterly condemned, although coming highly recommeuded. This description of hose, although it stood the pressure of 300 pounds to the inch when new, has been found to yield to 80 pounds pressure when six months old. California hose is pronounced far more durable, and as cheap, or cheaper. Chief Engineer Whitney gives it as his opinion, after years of experience, that single-riveted hose is more durable, cheaper and more advantageous than double-riveted. The hose should always be greased on the inside, because the pressure, when the hose is attached to either an engine or a hydrant, causes the oil to penetrate through the leather to the outer surface; while if greased upon the outside, it does not penetrate to any extent in tho act of greasing, or by laying; while, when the pressure comes, it is at once thrown entirely off from the leather, and does but little good. The superiority of California leather is mainly attributable to the excellence of the California oak for tanning purposes. Mr. John J. Fulton and Mr. M. M. Cook, we believe, are the only manufacturers of California hose; and we are pleased to record the fact that the work of each is considered superior to that from the East. There is no longer any necessity to go East for our fire hose.

THE WESTERN MOUNDS TO BE EXPLORED AND MAPPED.—Several of the Eastern scientific associations have united in the undertaking to have the ancient mounds throughout the West, thoroughly and systematically explored. Dr. W. De Hass, a gentleman who has already made the relics of a past age a careful study, has been appointed to take charge of this exploration. He is now on the ground engaged in preliminary operations. This important work has been delayed altogether too long. Thousands of these structures have already been destroyed, and the hand of improvement is constantly invading those which remain. The Doctor will map and measure those which remain, excavate such as may promise to reward such an examination, and publish the results in a large, superbly illustrated volume. He is satisfied that populous communities occupied, in pre-historic times, the vast alluvial regions and adjacent bluffs, where these mounds exist. The finely drawn theories ascribing them to fluviatile action, locss, etc., will probably be dissipated by these scientific explorations.

A MINIATURE LOCOMOTIVE.—A young machinist in Detroit, Mich., has made a locomotive engine and tender complete, about four feet in length, and weighing only 300 pounds. Attached are head light, bell, whistle, and every part to be found in a regular locomotive engine. It can be run with fifteen pounds of steam, though as high as thirty pounds can be put on if necessary. The boiler has thirteen flues. The maker has refused $2,500 for it.

THE PRAIRIE DOG.—Among his observation on the prairie, a writer says that the prairie dog has a very destructive enemy in the lynx, or American wild-cat. This quick and fierce animal hides in the grass in the outskirts of the dog-town, and pounces upon an unlucky dog that starts out to forage, and carries him off before he can whisk his funny little tail.

RAILWAY TRAFFIC OF CHICAGO.—No less than seventy-eight railway trains depart from and enter Chicago daily.

METEORS AND COMETS.—Professor Pepper, in his Lenten Lectures on "physical astronomy," at the London Royal Polytechnic, stated that fourteen years ago Dr. Bedford discovered the relation between meteor and comet, and announced their actual identity; that at the time, and long since, it was regarded as mere theory; but within the last two years astronomers have proved the truth of Dr. Bedford's discovery, which was made by a careful comparison of recorded phenomena from the earliest times. The Professor said that it had been proved by five mathematical elements of the orbits of five several comets and meteors, and that the discovery is regarded as one of the grandest additions to astronomical science; and stated that Dr. Bedford has propounded entirely new theories of astronomy, which are most profound and very interesting, and well worthy of being studied.

MINERALS IN MISSOURI.—Lead is found in more than 500 localities in Missouri. The veins run through twenty counties, and are spread over an area of about 6,000 square miles. The ore averages seventy-five per cent. of pure lead. Copper has been found in fifteen counties. Zinc is also very abundant. Little attention is, however, paid to either lead or zinc. We hear nothing of late of the tin mines. Iron, mostly specular, abounds in inexhaustible quantities, averaging about fifty per cent. pure iron, of a very superior quality. Coal has been found underlying thirty counties, reaching an aggregate area of about 27,000 acres, with a mean thickness of eight feet.

THE retail sales of intoxicating drinks in the United States, it is estimated, amount every year to the total value of all the railroads in the Union—about $1,500,000,000!

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE & STEPHENS.
13v16eow

BUERK'S Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address

BY MAIL.—The *Mining and Scientific Press* will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sen accordingly.

Mechanics' Fair Daily Press.

Having received permission from the Mechanics' Institute, we shall print the

Third Volume of the Fair Daily Press,

in the Grand Pavilion, during the approaching Exhibition, which opens on the 8th day of August, 1868.

Our publication of the DAILY PRESS, in the Pavilion in 1864 and 1865, met with marked success, rendering ample satisfaction to its patrons and numerous visitors attending the Fairs. We are now confident that, with improved facilities, experience, and active efforts, the present volume will be made still more attractive and useful for the increased thousands who will visit the Exhibition, and receive, gratitously, each issue

Fresh from the Press.

New and interesting features will be adopted. Each number will contain a large amount of sprightly local matter, together with much permanently valuable reading.

A limited portion of the paper will be allotted to a choice class of advertising, furnishing a favorable opportunity such as is rarely met with. Following are our uniform

Rates of Advertising:

One column during the Fair	$260 00
One-half column during the Fair	130 00
Per line (space of small type) during Fair,	2 00
Per line, 10 lines or more, during Fair	1 75
Per line, 30 lines or more, during Fair	1 50
Per line for single insertion	25

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form; we will otherwise assist advertisers in getting up their notices, when desired.

Notices of the Press:

Following are a few of the many compliments paid the previous volumes of the DAILY FAIR PRESS:

THE SCIENTIFIC PRESS proprietors strike off and give away thousands of their little sheet, entitled THE MECHANICS' FAIR DAILY PRESS. There were great crowds all the evening about the telegraph and the presses, many of whom had their first sight at the practical working of these great motors of civilization.—*S. F. Evening Bulletin, Sept.* 7, 1864.

SCIENTIFIC PRESS.—A printing office has been established at the Mechanics' Fair, and Messrs. DEWEY & Co., the enterprising publishers of the MINING AND SCIENTIFIC PRESS, are issuing from it a handsome double-sheet daily, which is a credit to themselves, its editors, and to the Fair.—*S. F. Morning Call, Sept.* 8, 1864.

THE MECHANICS' FAIR DAILY PRESS is the title of a very neat quarto paper published at the Industrial Fair Pavilion, by DEWEY & Co., of the MINING AND SCIENTIFIC PRESS. It reflects great credit, as does the weekly, upon the enterprise and ability of the publishers. We want it regularly.—*Reese River Reveille.*

Parties who intend to advertise will do well to subscribe at once for the amount of space wanted.

And Cocoanut Fiber for Upholstery,

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16tu

THE LATEST IMPROVEMENT

In Dentistry..

PATENTED DECEMBER 3d, 1867, by DR. G. W. COOL. The right of San Francisco reserved for his own use. The nature of his improvement consists in lining the entire concave surface with fine gold; it makes the plate twice as strong and one third thinner than the common vulcanite plate. This work has given satisfaction in every case. Please call at No. 14 Third street, near Market, and see specimens. All work warranted as fine as the specimens. Prices reasonable. 21v 6 3m

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at **11** o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **6th, 14th, 22d** and **30th** of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-atlantic Co's steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR JULY, 1868.

The following Steamships will be dispatched on dates as given below:

July 6th—MONTANA.....Capt. J. M. Cavarly, Connecting with HENRY CHAUNCEY, Capt. Gray.

July 14th—CONSTITUTION.....Capt. C. C. Comstock, Connecting with OCEAN QUEEN, Capt. King.

July 22d—GOLDEN CITY..... Capt. Wm. F. Lapidgo, Connecting with RISING STAR, Capt. Conner.

July 30th—GOLDEN AGE.....Capt. E. S. Farnsworth, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Canard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship NEW YORK, Capt. C. M. Faunilcroy, will be dispatched on FRIDAY, July 3d, at 12 o'clock, noon, from wharf, corner of First and Brannan streets, for YOKOHAMA, to connect with the GREAT REPUBLIC for HONGKONG, and COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Also, Heart Disease, Sore Eyes, Sore Throat, Scrofula, Salt Rheum, and all Skin Diseases. Secret Diseases of all kinds cured. DR. JAMES BROWN, No 340 Broadway, between Sansome and Montgomery streets, San Francisco.

☞ I also promise to cure horses sprung in the knees. Remedies sent by mail. 6v16-3m

To the North of Salt Lake.—It is now pretty definitely determined that the main line of the Central Pacific Railroad will pass to the north of Salt Lake, distant from the city some thirty-five miles, but with which it will be connected by a branch road. The company is putting forth most extraordinary exertions in pushing ahead the work of construction. Had it not been for the early and heavy fall of snow, the cars would now have been running to the Humboldt river, instead of only to Wadsworth, where the cars are to arrive to-day, July 11th. Great difficulty has also been experienced in getting iron; two of the rolling mills at the East on which the company depended for iron having recently been destroyed by fire. Iron, however, is now being conveyed across the Isthmus at great expense, to make up for what has been unavoidable delays. About three miles of track are now being laid daily. All this haste is being made to reach Salt Lake ahead of the Union road, and thereby secure the valuable trade of that region for the benefit of California. The people of this State can well afford a small extra tax, in the way of high fares, for a little while, so long as the money so obtained is being devoted to such a desirable object.

Election of Officers.—Imperial S. M. Co.—Trustees: A. Hayward, W. M. Bourn, John Barton, A. P. Stanford, W. H. Sharp, H. F. Cutter, and J. E. de la Montagnic; President, W. B. Bourn; Vice President, W. H. Sharp; Secretary, D. A. Jennings; Superintendent, J. D. Greentree.

Overman G. & S. M. Co.—Trustees: J. E. de la Montagnic, John Sime, John Johnson, James Paul and Peter Duncan; President, J. E. de la Montagnic; Secretary, T. J. Owens.

Roamaise Mining Co.—Trustees: W. Burling, J. W. Burling, H. D. Bacon; President, W. Burling; Secretary, H. D. Bacon.

New Incorporations.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

Point Lobos Avenue Association.—San Francisco, July 8th. Capital stock, $50,375; 155 shares, $325 each. Trustees, A. Mills, J. R. Farrish, Henry Mahan, J. W. Nye, C. Railsback, Henry M. Rosekrans, P. H. Blake.

Files Made and Re-cut.—We understand that it is the intention of Mr. Durning, of the Pacific File Works, 53 Beale street, to send East for steel suitable for the manufacture of files, and to go hereafter more extensively into this line of the business. Foundrymen, machinists, blacksmiths, millmen, and all others using files, will find it to their interest to save their old files, and have them re-cut at a saving of nearly fifty per cent.

The Women's Coöperative Union gives employment to a considerable number of sewing women in the city, thereby becoming, to a certain extent, a handmaid to the Labor Exchange. All kinds of furnishing goods are made up and sold at the store, No. 39 Second street, opposite Jessie. Every dollar invested in goods or stock is well expended.

The Wheat Crop.—Most flattering reports with regard to the wheat crop are coming in from all parts of the State. The amount planted seems to be fully one-third larger than ever before, while the yield will be much more per acre than it was last year. In the fields of Santa Clara the berry is larger and more plump than it was last year, and the yield in that county will be nearly double what it was last harvest.

Gold Discoveries in Colorado.—The telegraph of Tuesday says that astonishingly rich discoverics of gold have recently been made in the Cimarron mining region, in southwestern Colorado. New discoveries are being made daily. The news comes via Washington.

Woodward's Gardens, always a charming spot, is particularly attractive at this season of the year. All, old or young, will find much in the way of both amusement and instruction. The entrance is now on Fourteenth street, between Mission and Valencia.

New Mining Advertisements.

Chipiloncna Mining Company—District of Cres, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of July, 1868, an assessment of five ($5) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirteenth day of August, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirty first day of August, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees

JOHN F. LOHSE, Secretary

Office, 318 California street, up-stairs, San Francisco. jy11

Globe Gold and Silver Mining Company.—Location of Works: Monitor District, Alpine County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-fifth day of May, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No Certificate.	No. shares.	Amount.
George Hogan	42	5	$10 00
J W Clark	49	5	10 00
H A Bartholomew	79	100	200 00

And in accordance with law, and an order of the Board of Trustees, made on the twenty-fifth day of May, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, on the eighteenth day of July, 1868, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

V. B. POST, Secretary.

Office, Lombard street, one door from Dupont, south side, San Francisco. jy4

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of June, 1868, an assessment (No. 24) of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 533 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Wednesday, the twenty-second day of July, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twelfth day of August, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 533 Kearny street, corner of Sacramento, San Francisco, California. Office hours from 12 to 2 P. M. je20

Senator Silver Mining Company.—Location of Mine: Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of June, 1868, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 408 California street.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of July, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the thirty-first day of July, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINOARD, Secretary.

Office, 408 California street, San Francisco. je13

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

Notice.—The Annual Meeting of Stockholders of the Silver Sprout Mining Company, for the purpose of electing Trustees to serve for the ensuing year, will be held at the office of the Company, No. 408 California street, on TUESDAY, JUNE THIRTIETH, 1868, at 3½ o'clock, P. M.

T. B. WINOARD, Secretary.

San Francisco, June 5, 1868. je6-4w

The above meeting is postponed to Saturday, July 11th, 1868, at the same hour and place.

jy4 T. B. WINGARD, Secretary.

Siempre Viva Gold and Silver Mining Company, District of Zaragoza, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of June, 1868, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 318 California street, up stairs, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirty first (31st) day of July, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventeenth day of August, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary

Office, 318 California street, Up stairs, San Francisco, California jy4

Whitman Gold and Silver Mining Company. Location of Works: Indian Springs District, Lyon County, Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-first day of May, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077

8v13f SAN FRANCISCO.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPAREO TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8v13-1y Stove Store, No. 125 Clay street, below Davis.

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Mission st., San Francisco.

Hunt's Patent Wind-Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump.

Pumping Machines and general Machinery kept constantly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

23v16 **E. O. HUNT, Proprietor.**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non illuminating flame and light on a wick as easy as a lamp. 21v16 3m

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... $600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tholumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Manufactures in the West.

The Chicago *Journal* publishes a lengthy article under the above head, which will be found particularly interesting in connection with the publication in this paper of the 20th ult., under the title of "The Westward Tendency of Manufacturing Enterprise." The entire subject, particularly with reference to its bearing on the food question, is one of much interest, and cannot be too fully dwelt upon by California capitalists. We quote the following extract from the article in the Chicago *Journal:*

For some time Eastern manufactures have felt grave apprehension that they were about to lose not only their best customer, the Great West, for a large portion of their manufactures, but were to find in her a formidable rival. These apprehensions are not without foundation. Everything connected with the progress of the country makes the fact plainer every day that the West is destined, at no distant period, to become the great seat of manufacturing industry. The richness of the soil, the variety and abundance of her productions, her rapidly increasing population, and their diversified callings,—the wide extent of her territory, and being situated at the eastern termini of the Pacific Railroad, and made the receptacle of its immense business and freight, all are exerting a mighty influence that will revolutionize the industrial interests of the country and change the whole current of business. Everything, so far as human ken can discover, shows forth the fact that the West will soon become not only the center of trade, but of civilization also.

Western capitalists are already discerning the course towards which the current of mechanical industry is setting. Also skilled mechanics from the Eastern States, as well as from foreign lands, are taking cognizance of the fact, that the future of manufactures, and the necessary establishment to carry them on, are already taking up their line of march towards the setting sun, and locating themselves on the banks of our unfailing streams, on the shores of our large inland lakes, and within the limits of our thrifty villages. Every week our country exchanges bring us accounts of the starting up of new enterprises, the extension and enlargement of old establishments, the introduction of improved machinery, the acquisition of skilled labor, and the employment of more hands and a greater increase of capital. The significance of these steps foreshadows a great revolution in the commercial and industrial condition of the Western States, and the progress of these events will dispel the illusion of Eastern manufacturers and capitalists, that the Eastern States are to remain for an indefinite period the workshop of the country, and that their sister States outside of their limits must pay tribute to her trade princes.

In connection with this matter, it will be well for our people to remember that political economists hold, that an exclusively agricultural State never reaches the highest point of material wealth and prosperity; that they are dependent upon a variety of industries, a diversity of occupations; and that these are necessary to create a higher civilization, a more rapid change of ideas, a greater multiplicity of wants, better markets, quicker circulation, ample internal resources. These plain facts are coming home to the bosoms and business of our merchants and agriculturists. They now see that they are paying out of the State what might as well, and better, be retained in it; that they are purchasing the manufactures of the East at the highest prices and paying for them in agricultural products at a cost of transportation and brokerage that leaves a very small margin for profit, and had it not been for the extraordinary resources of the West, her people must long ago have become a community of bankrupts.

THE ROBIN AT FAULT.—A remarkable instance of the lack of the "hump of locality" in birds, came under my observation some years ago. I had nailed a board of moderate width under the eaves of a barn to form a resting-place for the nests of the cliff, or jug-swallow. It was inclined at an angle so as to form a sort of trough. A robin commenced building her nest in it, but seeming unable to fix upon any particular spot, deposited the mud and straw along the entire length of the trough, about ten feet. After working several days, she abandoned her task. Shortly afterward I saw a robin (whether the same bird or not I cannot say) attempting to build her nest in the same way, along the entire outer cornice of a house, about thirty feet.—*A. P. R., Geneva, N. Y.*

PRUSSIAN military chemists have reduced nitro-glycerine to a condition available for military use, and grenades filled with it and shot from guns of ordinary caliber are said to have smashed the strongest cuirass that ever covered the sides of an iron-cased ship. Nitro-glycerine has been reduced to a solid by precipitation. The combustibility of this dangerous explosive fluid is considerably diminished, while its force remains unimpaired. As the utmost caution has heretofore been absolutely necessary in handling nitro-glycerine, the value of the discovery is exceedingly important.

THE SANDWICH ISLAND TRADE.—Eighteen vessels, aggregating a capacity of 10,713 tons, arrived at this port during the first half of the present year. Over fifty per cent. of the tonnage was steam.

BAKER & HAMILTON

IMPORTERS AND DEALERS IN

Agricultural Implements, Portable Steam Engines, Hardware,

RUBBER BELTING, Etc., Etc.,

Nos. 17 and 19 Front street, San Francisco, and 9, 11, 13 and 15 J street, Sacramento.

Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,

With newly invented Water Bottom, which entirely surrounds the fire grate and ash-pit, forming underneath the ash-pit, as up the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any farm-yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash pit. The sediment has a free passage to the bottom of the fire-box, and can be blown off daily by the blow-off cock underneath the ash-pit, by which means the boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

HOADLEY'S THRESHING ENGINES,

HITTINGER & RAWSON'S IMPROVED HOISTING ENGINES, 6, 8, 12 & 20-horse power.

FOR SALE BY BAKER & HAMILTON,

WANTED IMMEDIATELY.—Several hundred Horses. Half-breeds of the best quality will do, if weighing from 900 to 1,100 pounds. Letters for information about Stock promptly answered.

I HAVE LEFT A FEW PAIR OF THOSE fine thorough-bred ANGORA or CASHMERE GOATS, recently brought from Georgia, by Mr. T. E. Holland, from the celebrated flock of Mr. Peters, which stood a comparison at the World's Fair at Paris, and were pronounced as fine as any in the world, which I will sell at reduced rates from our former sales of $1,000 a pair, in order to give stock raisers a chance; or, if desired, will sell ten or twelve Bucks at $250 each, and reserve the Ewes. Full pedigree given of each one. 19v16-1am3t

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

MINING IN CHINA.—The opening of the mines in China to foreign capital will undoubtedly form one of the leading subjects of negotiation in the revision of the foreign treaties under the Burlingame Commission. It is quite well established that China contains rich mines of silver, iron and coal. They have never been worked to any considerable depth, on account of the lack of capital, and the requisito machinery and engineering skill. The expected hook from Dr. MacGowan ought to be made to do something to advance such a measure, hy pointing out to the people and the government the advantages to be derived from such a policy. The world is waiting anxiously for important events, in the early future, which must grow ont of the Burlingame Commission, the establishment of the P. M. Steamship lino from this port to China and Japan, and the speedy completion of our trans-continental railroad.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Subscribe for the New Volume of the Mining and Scientific Press.

The proprietors of this journal will undertake to make the Seventeenth Volume of the MINING AND SCIENTIFIC PRESS (commencing July 1st, 1868), superior in many respects to former issues.

It will be printed on extra quality of paper, rendering it a handsome volume to file for future use.

An increased amount of editorial labor will be expended in the preparation of leading articles relating to the progress of scientific developments in various parts of the world; new discoveries in geology, mineralogy, metallurgy, and new processes and methods relating to mining in all its branches.

Illustrations will be given of apparatus for saving precious metals, and of machinery and inventions of general interest.

Each number will treat carefully on subjects of home trades, manufactures and domestic economy

Our mining summary and weekly stock report gives the latest news from the most important mines and mining districts throughout the Pacific States and Territories.

An official list of patent claims issued to inventors on the Pacific Coast, is published in advance of all other journals.

The latest prices of stocks are quoted; also the produce and market rates, metal market and prices of copper ores.

Our "Mining Shareholders' Directory" advises holders of meetings, assessments, dividends, sales, etc.

"Answers to Correspondents" afford much of interest to readers and of advantage to the community.

The Mechanical and Scientific Miscellany contained on a single page of each issue we are frequently told is worth the price of the whole paper.

Information contained in one article has been known to benefit a single subscriber an hundred fold the cost of a year's subscription.

The PRESS was established in 1860, and as a mining and mechanical journal has met with unrivalled success.

Sample copies sent free on application.

Subscription, $5 per annum.

HENDY'S
LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in operation at the Union Iron Works, corner of Mission and First streets. This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Over 200 machines in successful operation in this State.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

FIRST—In setting up, set the pan, A, level by the inner rim, near its center.

SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]

THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.

FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (8 Concentrators).....Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....Humboldt County, Nevada.
ROBINSON & McALLISTER M & M. CO. (3 Concentrators) Hunter's Valley, Mariposa County.
MIDAS MILL CO. (4 Concentrators).....Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....Owyhee District, Idaho.
GUADALUPE & SACRAMENTO G. & S. M. CO.....Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....Sonora, Mexico.
B. F. BROWN (1 Concentrator).....Melbourne, Australia.
JAMES HENTY & CO. (1 Concentrator).....Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, ESQ.—*Dear Sir:*—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1868.

J. HENDY, ESQ—*Dear Sir:*—In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets.

Respectfully, etc. W. H. RODDA, Supt.

An Additional call for Hendy's Concentrators

Has just been complied with, and the machines shipped to Grass Valley, Nevada Co., Cal., viz: One machine for the Empire Company, and two for the North Star. Hendy's Concentrators have been in constant use in these mills for more than eight months, and these orders completed a set of ten machines for each mill. The North Star Company have just added eight new stamps to their machinery.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented April 17th, 1866, and May, 15th, 1868."

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1846, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6 1y16p

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

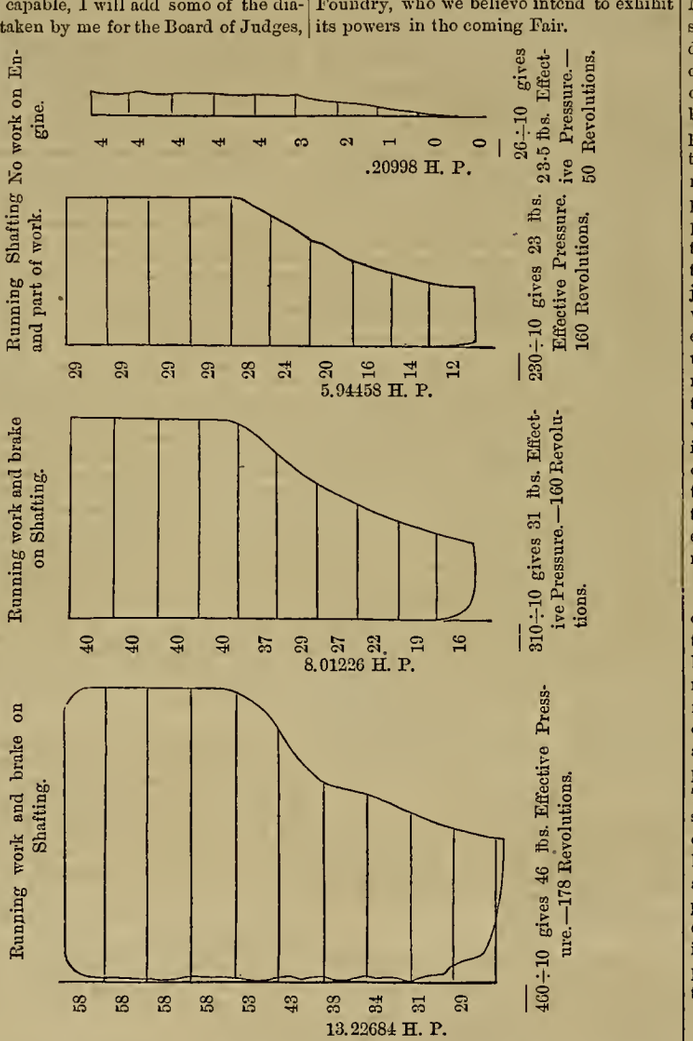
San Francisco Market Rates.
Stock Prices—Bid and Asked.
Notices to Correspondents.

The Hicks Engine—Important Testimony.



In our issne of May 16th, we gave an illnstrated description of the interior mechanism of tho Hicks Engine, together with some general remarks in regard to the manner in which it does its work. At the Fair of tho Mechanics' Institute, held in Lowell, Mass., in September, 1867, Mr. Marsh B. Horne, Managing Eogineer of the Merrimack Print Works, end a gentlemen who has constantly under his supervision eomo twenty engines, varying in capacity from 1,000-horse power downwards, wes requested by the judges of the Department of Machinery et that Fair, to examine and test, as an expert, one of the engines menufactnred by this compeny. The engine selected for this was one in use in Salem, of 6-inch cylinder, 6-inch etroke, reted and eold as a 15-horse power engine. The report of the expert was in eubstance as follows:

It is more correct in principle than engines of ordinary construction, because it accomplishes the same results by a simpler construction; its cheapnese is apparent from tho smallness of the number of its parts, and the small amount of finishing work required upon it; its emall numher of parts and large bearing eurface afford ample evidence of its durability; its weight is less than one-half that of ordinary engines of same capacity, and epaco occupied about one-quarter. The ehop records, as far as he had examined them, where these engines had been used, ehow economy in fnel. In luhrication and care it possesses decided advantages.

On the points of friction and power, Mr. Horne reports at considerable length, giving eeveral indicator cards, which we have reproduced. With reference to these cards Mr. H. eays:

Thc indicator cards taken by me, as given below, show that the power of this engine to overcomo friction, amounted to only 210-1000 of one horse power, or one and one-third per cent. of the nominal power of the machinc. This is tho most astonishing result in my experience, and I will let the figures carry their own inference. In my pinion, the frictiou varies in an almost infioitesimal degreo under one or one huodred pounds pressure of steam, as tho pressure is at ao opposito angle from tho wearing surface of the piston and does not eensibly effect it. As to the power of which this engino is capable, I will add somo of the diagrams taken by me for the Board of Judges, all of which were tho most absolutely perfect of aoy indicator cards I have ever eeen taken on any engine.

The Hicks' Engine is manufactured in this city by the proprietore of the Miners' Foundry, who we believo intend to exhibit its powers in tho coming Fair.

INTERESTING AGRICULTURAL EXPERIMENT. A French horticulturist has recently made somo very interesting experiments. In the autumn he filled three flower pots with coal ashes without admixture with any other substance; in one pot he sowed wheat, in another oats, and in the third etrawherry seeds. The pots were then placed in a garden bed and left to themselves. In tho month of March the plants were in a very thriving condition, and in April they were luxuriant. The wheat and oats ripened perfectly, the grains heing large and heavy, and the straw, in tho case of the wheat, 55 inches, and in that of the oats 43 inches high. The strawherry plants continued to flourish till Octoher, when it was necessary to transplant them, and after being planted out in the open ground they succeeded so well that they eurpassed all his other seedlings.

STATE FAIR.—The State Agricultural Fair will open at Sacramento on the 15th of Septemher and continue until the 25th, a period of ten days. The managers aunounce that the prospects are favorable for a good exhibition of all our indnstrial products. A letter from the Secretay, N. Hoag, informs us that the revised premium list will be issued in a few days, as also copies of the Transactions of the Society for 1866 and 1867.

THE OAKLAND POINT FOUNDRY, hitherto under tho joint charge of Messrs. G. A. Walker and M. T. Mead, will hereafter he conducted by the latter gentleman. It will be seen from the card which appears to-day, that Mr. Mead is prepared to manufacture all kinds of castings, and we should judge on very favorahle terms, as rents are comparatively low on that side of the hay.

A NEW TREATY WITH CHINA.—Among the first fruits of the Burlingamo Chinese Embassy, is the concluding of a new treety hetween the United Statee and Chine. By the terms of this treaty China ie to have a Minister Resident at Weshington—the firet step towards the establishment of equal diplomatic relations with the great powers of the world, which wae announced to be one of the objects of the Burlingame Embassy. The treaty also containe a clause providing for the interchange of emigration, which will facilitate American settlement and enterprise in that Empire. The people of eech conntry will also he thereby put more upon their mutuel good behavior toward one another. It would be extremely annoying for our people to he subjected to the verious modes of annoyance which are practiced toward Chinemen here; end such will most assuredly he the result unless some of the people of California soon mend their ways in this particular. Under the stimulus of this new treety with Chine, we may hope eon to see our commercial intercourse with that country greatly increesed; end may we not also hope for the early and general introduction there of the railroad and telegraph, as well as a more extended employment of eteam on her megnificent rivers?

NO WANT OF FUEL.—It hes heen very correctly seid that if all the coal mines in the world ehould take fire and hurn up, boundlese quantitiee of heat and light could now hy the aid of science he extracted from rivers and seas. By magneto-electric machines water may be decomposed without any expenditure except that of mechanical power, and kecpiog the power in order. There is power enough in the tides that sweep through Hell Gate to turn machioes enough to decompose water and furnish hydrogen for every purpose for whioh fuel and light is required in New York city. In plece of the enormous expenditure at present incurred for fuel and gas, our dwellings may yet be warmed and lighted hy the perpetual and undimishing power of gravitation.

EXPLORATION OF THE COLORADO.—A most important ecientific expedition was to have left the Mississippi frontier, about the first of this month, which will he known as the Powell Scientific Expedition. The party consists of about twenty-five men, who represent different departments of science. It is their purpose to concentrate and cross the Rocky Mountains at Berthoud's Pass, and from that point reach, hy the nearest route, the Grand River, and there huild hoats in which to descend thet river to ite junction with the Green River, where it becomes the Colorado. Here, if the grass is found in sufficient quantities for stock, the expedition will winter, and next spring descend the Colorado to Callville, and thence return home. This expedition, if it follows the present plans of the projector, will examine a section of the Colorado country hitherto unexplored—a wild, hroken region it is supposed to be, of great interest to the geologist especially, and it may he to ecientists repreeenting other specialties,

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[From our Traveling Correspondent.]

Mining Prospects in Northern California.

SISKIYOU COUNTY.

In Yreka but little is being done; hut beyond question, bere is a fine opening for capital, as there is evidently a large body of ground varying from one to two bundred feet in depth, and prospecting from twenty cents to two dollars per pan, which can only be worked by a drain cut and tunnel three and one-half miles in length. This ground is well worth tbe attention of capital, and should the enterprise be entered into, Yreka will again produce more than during all her past history.

On Humbug Creek there are a few claims doing very well; also quite a number of quartz leads that promise largely; among tbe most prominent are tbe Eliza, and the Siskiyou, tbe former is owned hy Lash & Co. They bave a 10-stamp mill, and have quite recently made a commencement. The ledge is of good size—about three feet—and looks well for top rock. The latter (Siskiyou) is owned by a San Francisco company — McPberson, Superintendent. This is a rich vein, nearly three feet in width, but in the opinion of the writer cannot he worked successfully hy any proccss now in use in the State. On McAdams Creek, drift mining is heing pusbed to considerable extent. Tbe ground is deep and worked at heavy expense; yet pays fairly to all interested. At Indian Creek, Miller, Decker & Co. have recently made a very good clean up from their hydraulic claim—nearly $6,000 from forty days' run. There is some fair looking quartz in this vicinity, also two mills; hut mines and mills, at present, are at a stand-still. Capt. Rusbmore is trying to *rush* matters for his company in San Francisco. He is endeavoring to opcu up a set of drift claims near the mouth of the creek. Scott's Bar is gradually heing transferred to the Celestials, who, by the way, are iu many instances making big money. The ground is very mucb spotted, gold coarse, aud either pays largely or nothing at all.

At Oro Fiuo, and Mugginsville—two camps abont a mile and a balf apart—hydraulic mining bas quite recently received a start, aud is attended with some very flattering prospects, particularly about Mugginsville. There is bere an exteusive range of ground that heretofore was considered worthless, bnt which is now paying largely, and that too by quite an inferior metbod, which they call bydraulic, but which in Nevada County would he termed irrigating. The difference is, the oue has from 50 to 80 fcet pressure, five to six inch truuk pipe, and 1¼ inch nozzle, running from 150 to 250 incbes of water; while tbe othcr, iu Nevada County, has from 200 to 300 feet pressure, 24 to 48-inch trunk pipe, and from three to five (instead of one) tbree-incb uozzles, using from 800 to 1,000 inches of water. If this ground pays the way as it is now heing worked, what would it yield by the Nevada method? If some Nevada miuer would pay a visit to this place, the answer would be tbree times the present yield at least.

At Oro Fino there is a large interest offered iu a fine tract of ground, to any company wishing to engage in a bydraulic enterprise where tbe ground bas been sufficiently prospected to warrant large returns whenever tho claims are opened.

ROUGH AND READY.

The same remarks will apply to this place as at Mugginsville, except that the grouud has only been prospected as yct. Tbere is, bowever, an extensive tract being opened by the Ætna Company—Wm. McConaugby, Superinteudent. This company is incorporated with 300 shares; capital $30,000, aud will he in active operation very soon. It is owned exclusively hy citizens of Scott's Valley, wbo repose the greatest confidence in the enterprise. At Frencb Gulch there is some very good looking quartz, some of which is very rich, particularly the George Schole lead, which is now heing worked by arastras. The vein is of fair widtb, imhedded in granite, sbowing considerable free gold, and containing a beavy proportion of sulpburets with a little galena. A tunnel is heing run to tap the lead some tbirty feet lower, wbere it is expected it will be better defined. On South Fork, near Callahan's Ranch, considerable crcek mining is being doue, paying only fair wages.

DEL NORTE COUNTY.

Happy Camp, as tbe name signifies, is rather a cheerful little placc, situated ou the Klamath River, about fifty miles above Orleans Bar. Mining in this locality, thus far, is conducted in a very rude state. The grouud appears to be good, in fact, No. 1; consisting entirely of bank or bench cbannels, prospecting beautifully, varying from five to twenty-five cents to the pan. The great want bere is capital to briug in water, whicb can be done hy only running from seven to twelve miles and obtaining from three to 5,000 incbes constant supply. There is an extensive belt of ground here, of some twelve miles in length, which only requires to he supplied witb proper ditcbes to develop a camp unsurpassed by any in the State. S. S. Richardson, Superintendent of a San Francisco company, has already made a commencement, bringing in a ditcb at au expense of some $40,000. He will be ready to commence mining tbis fall. But in tbe opinion of the writer, there are many other chances far superior to those taken, for further investments. This place is positively every way worthy of the special attention of capital, seeking to invest wbere speedy returns can he realized with a moderate outlay.

At Crescent City and viciuity, very little is being doue except heacb miniug; which, hy the way, is paying finely to those fortunate enougb to possess the ground, averaging from six to twelve dollars to the man. The pay dirt is found in old hcaches, existing in stratas of black sand, deposited by the surf at some remote pcriod. [Similar strata of black saud, containing gold, may he seen in the high bank of the Sacramento River, just east of the wbarf at Martinez, which was formcrly an ocean heach. It is from the breaking down of this bank that gold bas been distrihuted along the river beacb adjoining thercto.—Ens. Press.] The gold is very fine, aud is worth usually $19 per ounce. [The same character of gold may be found at Martinez.—Eds. Press.] The process of working, is to sbovel into a tom to separate tbe sand from the gravel, and from whicb the sand is carried over large sheets of copper plate, kept continually bright witb sodium, on which all tbe gold is saved.

THE COPPER MINES,

fourteen miles from this place, are, at present, at a standstill. The mines are good; so are tbe men who own them; but tbe market—alas! the copper market—is not. Not only bere, but tbrougbout tbe State the same condition exists.

KLAMATH COUNTY.

At Sawyer's Bar there are some few hydraulic claims beiug worked on the one-horse principle; yet paying very well considering the style of working—fifty feet pressure, five-inch pipe, and one aud one-fourth inch nozzle. The Findley claim, with this kind of machinery, realizes from six to eight dollars per man. They bave a large body of ground,—enough to last at least scventy-five years with the present manner of working. Unless science is brought to aid this place, Sawyer's Bar will live—yet not grow rich—for generations to come.

Five miles from this place, on tbe divide between the North and Soutb Fork of the Salmon, exists a belt of quartz, apparently as promising as any iu the State. The ledges are large, and present all the favorable characteristics of good pay rock. 'Tis true there have heeu several failures; but they are attrihutable to the want of experienced management, not to tbe fault of the mines. When capitalists and companies ccase to send out broken-down merchants, but in their stead will send intelligent, practical miners to superintend their enterprises, then, and not till then, will quartz miniug be considercd as safe as merchandizing or any other branch of business.

There are several fine looking mines on this helt, within a distance of four miles of each other. The Uncle Sam is a mammoth ledge, unprospected as yet, indicates finely, and would, undoubtedly, if properly opened by an experienced miner, prove to be of immense value. The Union, owned by Swain Bros., of Scott's Valley, is reputed to he a ledge of value, and will douhtless soon he worked in a paying manner. Attached to the miue is a steam mill of eight stamps, constructed at the Vulcan Foundry. The Live Yankee Company are developing their mine, expecting to start up soou. This, together with an eight-stamp water mill, is owned by William Coddington, of Humboldt Bay. A. B.

[Continued in our next.]

[From our Traveling Correspondent.]

Mining in Jackson County, Oregon.

Owing to a scarcity of water, very little placer mining is heing done this season. It appears that this region was visited witb less snow and rain, during the past winter, than any portion of country either North or South. At Sterlingville, however, there are a few claims doing a very fine business, for a short scason. Their ground is good, and plenty of it; what tbcy nced is capital to bring in water. In Jacksonville, quartz appears to be all the rage. Col. Drew, Superintendent of the Occidental mill, has demonstrated, beyond question, tbat good payiug gold-bearing quartz exists in plenty iu that vicinity. This gentlemen has a fine 10-stamp mill of Miners' Foundry construction, situated on Jackson Creek, about three miles from this city. The mill is located at the base of a high mountain, containing a series of ledges, varying in width from three to fifteen feet, and presenting as fine variety and character of ores as any in the State of California. Col. D. has introduced the "Rittinger boxes," (described in the Press some time since), in his process of working. This application is cheap, easily applied, and works to his entire satisfaction.

For particulars, as to the construction and working of said boxes, the readers of the Press are referred to an account given of them in the issues of Jan. 5th and 19th, 1867. That this district abounds in ledges, many of which will eventually prove to he first class, the writer has not the slightest douht; and as to cheapness of working, a more favorable location could not be had on the Pacific Coast, possessing an abundance of timher and water sufficient for all milling purposes. Wood is now heing delivered on the ground at two dollars per cord, and labor is only two dollars per day, or forty-five per month, includiug board. These rates are cheaper than at any other point; to account for it, the reader has only to be made aware that this district borders upon one of the finest valleys, and most extensive agricultural districts west of the Rocky Mountains. B.

How to Shoe a Horse.—Bonner, of *Ledger* notoriety, who never does anything by halves, is as particular with the minutiæ of bis business as be is with business matters of more weigbty moment. This peculiarity is most strikingly developed in the importance wbicb be attaches to the shoeing of the delicate hoofs of his higb-blooded trotters. It is said that he always superintends this operation in person, the details of which he not only directs, hut even assists in personally. The details of Bonner's process of shoeing a horse are given as follows:

"As tbe perfect flatness of the shoe is necessary to even aud comfortable stepping, Mr. Bonner bas procured a smooth and flat block of marhle, npon wbose surface he places every shoe before it is nailed to the horse's boof, and if the iron does not lie plump on the stone, it is hammered and filed until a thoroughly level surface is obtained. He bas also a tbcory ahout fastening a shoe. He makes the smitb hammer the nails alternatcly on eacb side, stroke for stroke, nail by nail, left and rigbt, so tbat the tightening of the shoc to the boof, is gradual and equal on both sides. He also has the shauks of the shoe stretched a very little wider than the hoof, and hy this system of driving the uails, the foot is brought out to the sboe, aud the frog and beel are expauded iu the operation. The result is highly couducive to the soundness and toughness of the hoof and the freedom and firmness of step in tbe animal."

Hops.—Tbere are 145 acres of hops in Ukiah Valley, Mendocino County.

Ante-Mortem Benevolence.

Acts of benevoleuce, on a large scale, entered upon by men of wealth during their lifetimes, are becoming quite frequent of late years. Sucb a practice is much better than to wait until the death of the philanthropist gives opportunity, as too frequently bappens, for a large portion of the funds intended for benevolent objects to be uselessly squandered in vexations lawsuits hetwecn heirs and executors. Moreover, no man so well knows how to carry out his own ideas of hencvolence, as he who first conceives and resolves to put them into practice. Our own Peahody is the noblest example of this kind which has yet gladdened tbe hearts of the poor and needy. Mr. Whitworth, of Manchester, Eng., is another notable instance of this sort of benevolence. He has recently donated £100,000 for the foundation of thirty scholarsbips, for the pursuit of mechanical studies. These scholarsbips will he of £100 each, and will be maintained by the interest of the above named sum. Ten of theso scholarships are to be competed for and awarded in May, 1869. Mr. Whitworth is well known as a mecbanician of great repute. He is tbe head of one of the most extensive manufactories of macbinery in England. He is the inventor of the beautiful apparatus for marking extremely minute intervals of apacc, whicb is considered by experts as a marvelous contrivance; also of the celebrated Whitworth rifle and the ordnance wbicb hears his name. Many other names might be enumeratcd; but our preseut object is to call attention to the following, which we condense from the Sheffield (England) *Independent* of the 23d of May last:

We are glad to learn that the very handsome benefaction of Mr. Mark Firth, which we mentioned yesterday, is even more comprehensive than we were at first led to suppose. With a generosity as gratifying as it is rare, Mr. Firth has resolved to erect and endow 36 almsbouses, on a site of two acres of land at Hauging Water, Ranmoor, for the accommodatiou of 24 single persons, either men or women, and 12 married couples. The cost of the building, land and endowment, will be about £24,000. The charity will he open to natives of Sheffield, without respect to religious belief, on certain conditions to he yet settled. Each single inmate will receive 7s. a week, and eacb married couple 10s. The plans for tbo building, wbich are completed, will be at once proceeded with. The design is Gothic, in the form of a quadrangle, and the material rock-faced greenstone. The bouses in the center wing stand back to back; those in the return wings are single. The middle of tbe center wing is occupied by a pretty little chapel for tbe use of the inmates, from whicb rises au ornamental tower. Gas and water will he laid on to every honse. Standing in a beautiful neighborhood, the building will enjoy a warm, sheltered, sunny aspect, eminently suited to the residence of the aged and infirm, and will itself form an attractive featnre in the landscape. Long may it continue to fill its useful place, and at the same time bear testimony to the liherality of one of Sheffield's manufacturing princes, whose generosity is shown, not by last will and testament, at the expense of bis heirs, but by self-sacrifice made in the prime of life.

Useful Information.—*A Barrel* contains 10,752 cubic inches. A box 24 incbes long hy 16 inches wide and 29 inches deep—that is on the inside—will hold just a barrel.

A Half-Barrel—Make a box for this 24 inches by 16 and 14 incbes deep. This will contain 5,376 cubic incbes, or just balf a barrel.

A Bushel—This has 2,150 2-10 cubic inchcs. A bushel box will be 16 8-10 incbes square and 8 inches deep.

A Half-Bushel—A box 12 inches long by 11 2-10 inches wide, and 8 incbes deep, will bold half a bushel.

A Peck—A box 8 incbes by 8 4-10 inches square and 8 inches deep, is a peck.

A Half-Peck is 8 by 8 incbes square, and 4 2-10 inches deep, or 268 5-10 cubic inches.

A Half-Gallon—This contains 134 4-10 cubic inches. A box 7 by 4 incbes, and 4 8-10 inches deep, has just that quantity.

A Quart—4 by 4 inches square, and 4 2-10 inches deep.

Mechanical.

Drilling vs. Punching Steel Plates.

We have already called attention to the great advantage of drilling over punching for iron boiler plates. In the use of highly carbonized or very hard steel, the advantage of drilling over punching is still more apparent. The particles or crystals of very hard plate are cubical in form, and have a very firm adherence to each other; and while they offer great resistance, they lack the elasticity of softer steel. In softer steel the crystals are somewhat elongated, overlap each other, and have a certain amount of elasticity, combined with a capacity for still greater elongation. Hence, where a punch penetrates hard steel, a series of fractures occur, which extend to a greater or less distance into the mass, separating the crystals and weakening the plate much more than is due to the diameter of the opening made. The different form of crystals in soft steel, and their more yielding nature, admits of the passage of the punch with less fracture. In drilling, all fracture is avoided.

From careful experiments made with different qualities of steel plates, it has been proven that the average advantage gained by drilling over punching is fully 22.5 per cent. in point of tensile strain. The gain is larger in brittle steel or iron than in the softer metal of either kind; and larger in steel than in iron.

In the use of steel, annealing is found to be of very great advantage. It has been shown by actual experiment that hard steel which has been annealed after punching has *sixty-four per cent.* greater tensile strength than the same steel submitted to test before annealing. Annealing reduces the amount of carbon in the steel, and as a consequence changes the crystallization from cubical to that of an elongated form—approaching to fibrous.

Crucible-made steel verges much nearer to the fibrous character of fine iron than steel prepared in any other manner. The superiority of Crupp's steel is mainly due to its mode of crucible conversion. Even crucible steel is sixteen per cent. stronger when it is annealed after being punched, than when punched without being annealed.

These facts are especially important in all cases where steel plates are used, as for ship building, armor plating or boiler making. As much is now being said with regard to the introduction of steel boilers, it is especially important that this class of facts should be kept in mind with reference to that specialty. Cold hammering, either steel or iron, is very injurious; and especially so in the case of steel, which is often rendered absolutely worthless by such means.

Casting Metals in Plaster of Paris Molds.—Mr. A. C. Small, of Augusta, Ga., uses plaster of paris molds for castings of low fusible metals. He dries the molds perfectly in the open air, and when about to use them, warms them just enough to prevent their chilling the metal when poured in. After warming, he holds them over a flame that produces a large amount of smoke, until the inside of the mold is completely blackened over. About 200 castings can be obtained from each mold.

Large Wire Rope.—The largest, longest and heaviest wire rope ever made in one piece, has recently been completed at the works of John A. Roebling, Trenton, N. J. This rope is intended for hauling trains of coal cars up an inclined plane, at the north slope of the Wilkesbarre Mountain, Pa., and the load hauled up every trip consists of 10 cars weighing 30 tons, and laden with 55 tons of coal, making a total weight of 85 tons. The length of the rope is 3,700 feet; its diameter a little over 2¼ inches; weight 20 tons.

Circular Ships of War.

A novel vessel of war has recently been proposed by Mr. John Elder, of the well-known firm of Randolph and Elder, of Glasgow, Scotland. Mr. Elder recently read a paper, describing his plans, before the Royal United Service Institution. It appears from the description which he gives that he proposes to make his armor-clad circular in plan, the portion below the water-line, and for a short distance above it being a segment of an enormous sphere. The upper portion of the vessel is also formed, in part, of the segment of a sphere, the two segments uniting in a sharp circular edge, which Mr. Elder proposes to use for cutting purposes, as we shall explain presently. In the center of the vessel is a circular armor-plated battery or fort constructed to mount ten guns. Of course, being circular, the vessel has no head or stern, and it is to be fitted with machinery for propelling it indifferently in any direction. The propelling power is to be obtained by the projection of jets of water through convenient openings, the jets being supplied by some of the arrangements lately brought out by Mr. Charles Randolph. These jets will not only propel the vessel in any direction, but, by means of deflecting plates fitted to the nozzles, they will enable a rotary motion to be imparted to it. Mr. Elder expects to be thus able to rotate the vessel at a speed of about 10 revolutions per minute, and, as it is possible to load and fire a heavy gun in one minute, each of the ten guns could be thus fired at any object as it came to bear upon it, and could be reloaded during the time the remainder of the revolution was being performed. Mr. Elder also proposes to use the sharp edge of the revolving vessel as a kind of immense circular saw, and by its use to cut down an enemy's ship. As regards the resistance to propulsion of these circular vessels, Mr. Elder has carried out some experiments on models which seem to show that with a given displacement the resistance is but about 10 per cent. greater with the circular form than with a vessel of the Black Prince model. The spherical shape undoubtedly gives for a certain displacement a less area of wetted surface than any other form, and the skin resistance would be therefore proportionately diminished. The circular form also possesses advantages in the way of giving steadiness, large space for stowage, etc., and altogether Mr. Elder's scheme, says the *Engineering*, from which we condense the above, although rather startling at first sight, possesses many merits which render it entitled to careful consideration.

Steel Rails.—The impression is becoming more and more prevalent that steel rails must take the place of iron upon the railroad track. The constantly increasing weight which is being put into locomotives is doing much to bring about this necessity. It is found necessary at the present time, to have a much stronger rail than formerly for this reason; and it is proposed to attain both strength and durability, and at the same time decrease the weight of metal employed, by substituting steel for iron in the rail. The New Haven Railroad is now laying down about thirty miles of steel rails, and will substitute steel for iron as fast as the present iron rails wear out on other parts of the road. Steel rails cost only about twice as much as iron, and are said to wear ten times as long. The additional safety attained by their use is a most important consideration with the traveling public.

Compressed Wood.—Mr. Ed. Spaulding, of Brooklyn, New York, recently exhibited to the American Institute, two blocks of oak, one of which had been forced through an iron die, by an hydraulic press, at a pressure of about sixty tons to the square inch. The wood was compressed as solid as mahogany, while a similar piece from the same stick, but not so treated, was badly checked. The second piece was subsequently subjected to hydraulic pressure, and afterwards submitted to a high temperature for two weeks. Mr. Spaulding, who has recently devised this process, claims that the most inferior woods may, when thus treated, be employed for a great number of mechanical purposes, for which in their natural condition they are totally inapplicable. The invention, being an entirely new one, was regarded by the Institute as one of much importance.

Scientific Miscellany.

Sulphuric Acid and Platinum.—It has generally been conceded, and is taught in all text books, that platinum is not acted upon by acids; but Mr. Scheurer, of Thann, has recently shown that this metal is not only materially acted upon by sulphuric acid; but has actually measured the waste. He has shown that in an alembic employed in the manufacture of sulphuric acid, of sufficient capacity to yield 8,000 pounds of concentrated acid daily, the waste of metal is one-quarter of an ounce per day; and that, too, when the acid is nearly free from nitrous vapors. Two or three times as much is lost when the acid is no freer from these vapors than it ordinarily is. New vessels suffer less than those that have been a long time in use. The addition of sulphate of ammonia to the acid, in sufficient quantity to render the nitrous vapors inert, is a partial remedy. Platinum, however, which contains iridium, is much more durable than the pure metal. Since the discovery of M. Scheurer, platinum, intended for the manufacture of vessels to be used in the production of sulphuric acid, is alloyed with a small quantity of iridium.

Comets.—There are so few comets which revolve in short periods around the sun, and these few are subjected to so many dangers—existing seemingly under the continual risk of dissolution—that a certain interest attaches to the search for periodical comets at their successive approach to perihelion. Of nearly twenty comets which are recognized members of this class, only eight have been known to return at the predicted seasons, and one of these has lately failed to appear at the appointed time, although all the leading observers in Europe have swept diligently with their telescopes over the region along which it was expected to travel. No one knows what has happened to this particular comet. Its path had not brought it near to any of the large planets; but a certain suspicion had already fallen on its character for consistency, since, as at a former visit, it had separated into two distinct comets under the very telescopes of observers. Another comet of the same class was watched during two revolutions and then vanished. But astronomers had an inkling in this case of the cause of this catastrophe, since it was known that Jupiter had introduced the stranger within the solar system, and it was recognized that that giant comet-compeller was competent to dismiss the comet from the neighborhood of the sun. The majority of those comets, however, which have disappeared from our ken, have done so without any assignable cause.

Jupiter appears to be the great comet disturber of our system. It is pretty generally conceded that it has been the ruin of several, and it is well known to have more or less modified the motions of several others. When anything appears wrong in the course of one of these celestial wanderers, which has a path that nearly approaches this giant disturber, astronomers are apt to keep a pretty good lookout in the neighborhood of that planet. Quite a number of comets have a period of from five to six years, and an orbit but barely reaching beyond that of Jupiter.

Recent Geological Changes.—The geological changes that have occurred in China and Japan are almost incredible, and are decidedly more rapid than any of which we have any record in other parts of the world. The land is elevated and gains on the sea. Mr. Bickmore, an American traveler, has made careful observations from Canton up to the mouth of the Amoor river, and his general conclusion is that the facts, taken in connection with the dry beds of friths and bays along the Siberian borders of the Arctic Ocean, and the remnant of the old gulf that once washed the eastern flank of the Ural, enable the geologist to form an idea of the large increase of the Asiatic continent within a comparative recent period.

A Discovery in Magnetism.—M. Gerard is said to have discovered a very curious fact. If a metallic ring made of wire, the diameter of which varies regularly, so that at one side of the ring it is very thin and at the other side relatively very thick, be suspended over an electro-magnet, it will revolve. The author sees in this fact the germs of a new system of electric telegraphy, for the details of which we wait.

The Phenomena of Light—Interesting Exhibition.

A number of experiments, as illustrating the phenomena of light, were performed the other night in the Philadelphia Academy of Music, by Professor Henry Morton of that city. The following, among others, were specially interesting:

"The professor placed himself and apparatus on a platform secured to one of the stage traps, and was then raised to a great hight above the floor, at which elevation he burned in the compound blowpipe a piece of thick steel wire rope. The fountain of scintillating sparks and drops of melted steel—which, descending in a broad sheet some fifteen feet in width, poured upon the stage and rolled in a torrent of fiery hail toward the foot lights—was a sight never to be forgotten. A wheel five feet in diameter, supporting electrical tubes, was rotated, while flashes of electric fire from the largest induction coil in the world, belonging to the University of Pennsylvania, were passed through, producing a dazzling star of constantly changing colored rays.

The drop curtain, descending for a few moments, rose again, displaying a beautiful palace scene, illuminated by numerous lime lights, judiciously placed. There then marched in a great number of masked figures, in costumes representing the colors of the rainbow, and bearing banners with brilliant devices. These taking positions, formed a tableau equal in brilliancy and beauty of general effect to anything we have ever seen upon the stage. At a signal the white light was extinguished and its place supplied by pure yellow light, equally bright, when every trace of color disappeared, and the entire phalanx became a ghastly company of specters bearing banners of white and black. The means for producing this yellow light is a device of Professor Morton's, entirely new and eminently efficient—in fact, the entire house was illuminated with it from the stage, so that the same wonderful change was manifest in the faces and costumes of the audience."

New Manganese Battery.—A battery, composed essentially of peroxide of manganese and a sinc liquid, chloride of ammonium, has recently been constructed by M. Leblanche, and according to *Les Mondes*, has been already somewhat extensively adopted, or, at least, taken on trial by several telegraph companies on the Continent. It has been long known that peroxide of manganese possesses an electric conductivity similar to that of metals. The author only uses the natural crystalline peroxide of the purest quality. This is broken up and placed in a porous vessel, where it surrounds a carbon plate, forming the positive pole of the battery, the negative plate outside the porous vessel is simply a thick rod of zinc; the liquid which bathes both plates is a concentrated solution of sal-ammoniac. It appears to be a very constant form of battery, and exceedingly economical.

P. Pellogio describes a contrivance by which the troublesome "humping" peculiar to certain liquids when submitted to distillation, may be obviated. A glass tube, as wide as is convenient, is passed through the tuberlure into the body of the retort, nearly to the bottom. The upper end of the tube is bent at a right angle, and drawn out to nearly capillary dimensions, thus estsblishing a communication between the interior of the retort and the outer air. With this arrangement of apparatus such liquids as methylic alcohol, sulphuric acid, etc., distill as smoothly as water.

Magnesia Cylinders for the Drummond Light.—M. Caron has published a short account of the way in which he makes his magnesian cylinders for the Drummond light. He takes magnesia which has been purified from alkalies and the other alkaline earths, and after moistening it with a solution of boracic acid, presses it into molds. The reason for separating the other alkaline earths and alkalies is that their presence would affect the color of the light. The boracic acid would probably give a greenish tinge to the flame.

Speed of the Senses.—The speed with which the sensation (of pain for instance) is carried forward from the part affected to the brain is far from being, like electricity, instantaneous; it travels at a rate of less than 100 feet per second—less rapid than the flight of an eagle, which is 130 feet per second.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

H. C. Leonard, Superintendent of the Oregon Iron Works, at Oswego, about nine miles south of Portland, has sent us a fine sample of the iron produced in that establishment, together with a beautiful specimen of furnace product, taken from the bottom of the stack after "blowing out." The same box also contains a beautiful sample of the ore—hydrous oxide of iron, of the limonite group. The specimen before us, judging by the eye, is nearly free from earthy matter and probably contains over eighty per cent. of oxide of iron. The average yield of the ore as it is taken from the mine, is about 50 per cent. We have numbered these specimens for our cabinet respectively, 211, 212, 213. The extraction of the ore at this mine costs only $1.50 per ton. It is found in large quantities in the immediate vicinity of the works. An especial interest attaches to these works as the first which have been established on this coast. Although located in Oregon, several of the heaviest stockholders are residents of this State. The first iron produced at these works was on the 24th of August, 1867, when about six tons of very excellent metal was run out, which was forwarded to this city and distributed among our foundrymen, by whom it was worked up, and pronounced to be of very superior quality. Quite a large shipment was received here from these works, a few weeks since, which was duly noticed in our columns. The works are now in constant operation, turning out about eight tons of pig iron each twenty-four hours. It is to be hoped the time will soon arrive when this coast will be able to place itself entirely independent of the East for all the iron which enters into its commercial requirements.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

Issued for the Week ending June 30, 1868.

79,400.—Improved Reamer for Wells.—A. J. Salisbury, San Buenaventura, Cal., assignor to self and Thomas R. Bard, of same place:

I claim the combination of the branches A, cross-bar B, toggle-bars D, shank C, and spring S, substantially as and for the purpose set forth.

79,425.—Improvement in Machine for Kiln Drying.—Ashbel B. Winegar, San Francisco, Cal.:

1. I claim a machine for drying salt and other substances, composed of the furnace A, pan or disk B, the radial arms G, G, spindles H, H, with the hoes or stirrers I, I, I, attached to them, with the movable bar J, for turning them in different directions, so as to continually stir and turn the salt in the pan or discharge it at will from the periphery, the whole constructed and arranged to operate substantially as herein described.

2. The sliding board or plate O, at the bottom of the hopper, operated by the spring P, cords S, lever T, and beveled pinion U, substantially as and for the purposo specified.

79,453.—Improved Furnace and Condenser for Reducing Quicksilver and other Ores.—Thos. W. Dresser, San José, Cal.:

1. I claim the vapor-tight hopper J, and siphons u, u, in combination with this or other smelting furnaces substantially as described,

2. The division plate H, H, and the endless carriage F, constructed and arranged to operate substantially as and for the purpose described.

3. The combination with a vapor-tight furnace A, provided with a hopper J, either of the pumps Q, R, S, substantially as and for the purpose specified.

Fires.—As many fires occur in the city of New York in one week, as takes place in Paris in an entire year.

An Important Textile Discovery.

The Department of State has received information from the U. S. Consul at Lambayeque, Peru, that an important discovery has recently been made in Peru of the silk plant. Preparations are being made to cultivate it upon a more extensive scale. The shrub is three or four feet in highth. The silk is inclosed in a pod, of which each plant gives a great number, and is declared to be superior in fineness and quality to the production of the silk worm. It is a wild perennial, the seed small and easily separated from the fiber; the stems of the plants producing a long and very brilliant fiber, superior in strength and beauty to the finest woven thread. Small quantities have been woven in the rude manner of the Indians, and the texture and brilliancy are said to be unsurpassed.—*Am. Farmer.*

We are the more inclined to place confidence in the above alleged discovery from the following facts: Thirty-three years ago this summer, the mate of a vessel arrived in Beverly, Mass., from a whaling voyage in the Pacific Ocean, and presented to the editor of this paper, among other curiosities, several pods, similar in appearance to the pod of the common milk-weed, but something over twice as large. Its color was dark brown, and the shell quite hard, so much so as to require a smart blow to break it. When opened, a large handful of beautiful, silky fiber was obtained, the seeds of which were very small and fine, and easily separated from the fiber. The fiber exceeded in smoothness and gloss the finest reeled product of the silk worm we ever saw, and according to the best of our recollection, was something over four inches long, and quite strong, lying perfectly straight and even in the pod.

It was our intention at the time to submit the fiber to the inspection of some party competent to judge of its value; but before a convenient opportunity occurred, the pods with the data furnished had been mislaid and lost, and the donor had disappeared.

We have frequently, in the years that have since passed, inquired of persons who were familiar with the islands of the Pacific Ocean and the South American Coast, if they had ever seen anything of the kind in those quarters; but have never been able to hear of it. Our impression is that the discovery, as above reported by the U. S. Consul at Lambayeque, Peru, is identical with the product brought us thirty-three years ago. Our informant assured us it grew wild near some port which he had visited, and that he had brought the sample home under the impression that it might furnish a good substitute for our sea island cotton. If such a product as that to which we refer can be grown cheaply, we see no reason why it may not prove equally as valuable to the world as either cotton, silk or hemp. We shall watch with much interest for further developments with regard to what we are constrained to believe will yet prove a very valuable discovery.

Sherman Day for Surveyor General.—The telegraph has announced the nomination, for United States Surveyor of California, of Hon. Sherman Day, of Oakland. Of course such a nomination cannot fail of being confirmed by such a Senate as now constitutes the higher branch of our national Legislature. A more honest and capable man for that position cannot be found this side of the Rocky Mountains. Mr. Day is a mining and civil engineer by profession, and a man of sterling worth and undoubted integrity. The President has honored the office and himself by making so judicious and proper a nomination.

No Place Like Home.—The N. O. *Picayune* says that all the attempts of the Southern people to establish colonies in Honduras, Brazil, and other foreign countries, have failed. The same paper says that the people of the South will soon learn that their own country, after all, is the best in the world, if they will only stay in it and devote themselves earnestly to its welfare.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, July 18, 1868.

City Stocks.

The miscellaneous stock market is quite inactive. Sales of San Francisco Gas stock were made at $75; Omnibus Railroad at $75, and North San Francisco Homestead at $30. The annual meeting of the Pacific Insurance Company was held on the 14th inst. Income for the fiscal year ending June 30th, $766,215, of which $399,708 was for premiums on fire risks and $227,751 for marine. Disbursed—fire losses, $194,993; marine losses, $132,259; dividends, $60,000. Assets, $1,433,038; surplus over capital, $433,038; liabilities, $25,070. Risks written during year—fire, $33,900,983; marine, $16,843,513—total, $50,744,496. Risks in force June 30th—fire, $29,112,615; marine, $2,273,497—total, $31,386,012. C. A. Laton, Esq., the late efficient and obliging Marine Secretary of the above company, goes East shortly to take charge of the agency there. After a thorough inspection of the field, both in the Atlantic, Western and Southern States, Mr. Laton, according to direction of the Board, will establish a new department in the Northwestern States, with head quarters at Chicago, Ill., of which he will be General Agent. Andrew Baird has been selected to fill his place here. The following quarterly dividends have been announced since our last issue: Fireman's Fund Ins. Co., 3 per cent. for quarter ending June 30th; National, ditto; California, 2 per cent. per month. The following are the monthly dividends: Bank of California, 1 per cent.; California Steam Nav. Co., 1½ per cent.; North Beach Railroad Co., ½ per cent.; Omnibus Railroad Co., ½ per cent. Western Union Telegraph Co., $2 per share in currency; Cal. State Telegraph Co., $1 per share. The French Savings and Loan Society pay a dividend of 10 per cent. per annum, free of Federal tax, for the six months ending with June. At the close, Spring Valley Water Co., sold at $66 50.

Mining Share Market.

During the period under review, ordinary activity prevailed in the mining share market, and the transactions included the usual list, Hale & Norcross and Overman having been the most prominent. A general improvement is manifest, and outsidere exhibit an increased disposition to enter the field. At the close, the market denoted more tone, and the prospects are fair for a materially improved business.

Savage—has been in moderate request, improving from $140 to $143, declining to $138, and at the close selling at $140. The ore extracted during the week ending July 11th, amounted to 1,351 tons, showing an approximate yield of $41 31 per ton. On the fourth station, north mine, the prospecting drift is getting into gypeum as they approach the Gould & Curry line—which is an unfavorable feature. In the south mine of the same level, the breasts show an improvement over last week. On the fifth station, north, there is no change in the main northwest drift, nor in the west cross-cut. The east cross-cut, which has been entirely in porphyry, is said to be getting into some quartz with water, and ore may be found in that direction. In the south mine, same level, the breasts look better than heretofore, and the quality is steadily improving. The south drift is still in good ore. Some progress has been made in opening the sixth station, but the ground is so very bad that even with the large force employed, little headway can be made. From the usually interesting and elaborate annual report of this company for the fiscal year ending June 30, 1868, we take the following statements:

Ore—On hand, July 1, 1867, tons	2,865	
Extracted during the year	87,342	
		90,207
Reduced, tons	84,627	
Sold, tons	3,897	
		88,524
On hand, July 1, 1868		1,683

Average yield—1st class, $359 52; 2d class, $78 16; 3d class, $37 31—total average, $40 84. Cost of production, $7 21; reduction, $13 74—total cost per ton, $20 95.

RECEIPTS.

Bullion	$3,484,185 72

Labor	311,277 74
Timber and lumber	102,107 52
Fuel	50,368 93
Taxes	40,635 13
Legal expenses	46,169 40
Salaries	20,650 00
Supplies, etc.	52,268 45
Freight on bullion	27,857 66
Other disbursements	69,618 80
Cash on hand, July 11, 1868	106,319 50
	$3,608,550 00

The assets, exclusive of mine and mill property, amount to $223,403, and the liabilities to $29,358, showing a surplus of $194,045. The property assets, in round numbers, are estimated at $250,000. The following are interesting comparisons:

	1866-67.	1867-8.
Yield of ore, per ton	$41 97	$40 84
Cost of production	7 81	7 21
Cost of reduction	14 04	13 74
Total cost	21 85	20 95
Profit	20 02	19 99

Total ore product from date of organization, nearly seven years ago, 270,521 tons; yield in bullion, etc., $11,327,700; assessments, $188,000; dividends, $3,560,000. The officers of the company for the ensuing year are: Trustees, Alpheus Bull, M. Mayblum, J. D. Fry, A. Hayward, Thomas Bell; President, Alpheus Bull; Secretary, E. B. Holmes; Treasurer, W. C. Ralston; Superintendent, Charles Bonner.

Chollar-Potosi—has been less active, declining from $211 to $130, and at the close realizing $190. From the annual report for the fiscal year ending May 31st, we glean the following: Amount of ore extracted from the mine, 70,330½ tons, of which 29,792 tons came from the Third Santa Fé section and 15,671 from the Blue Wing. The total quantity of ore milled was 77,957¼ tons, and the following figures will illustrate the cost of production:

Average yield per ton	$24 14
Cost of milling per ton	$14 75
Actual cost of extracting per ton	4 24
Filling mine and dead work per ton, extracted	33⅓
Taxes per ton	22½
Expenses at New Works per ton	1 87
Incidentals per ton	26
	21 68
Net yield per ton	$2 46

The amount expended for account of New Shaft was $131,835 86. In the old mine, as nearly as can be calculated, there are 33,000 tons of ore that will afford a small margin over expense of mining and milling. The new shaft penetrated the west wall at a depth of 913 feet from the surface. Here a station has been made, and an incline at an angle of 45 degrees has been driven to the extent of 266 feet. Two stations have been made in the incline—one at 1,000 and the other at 1,100 feet, leaving 247 feet of unprospected ground overhead. They are about to drift east from 1,100 level, and the incline will be continued down to another station. These deep driftings are of great importance, as upon their favorable development depends the success of the company in the future. We condense the following from the Secretary's report:

RECEIPTS.

Balance on hand per last statement	$108,947 21
Bullion product	1,873,306 18
Ore sold	32,115 31
Assessment account	182,000 00
Sundries	5,259 36
	$2,201,628 6

DISBURSEMENTS.

Dividends	$353,200 00
Labor	320,821 97
Timber and lumber	109,723 91
Taxes	19,268 69
Reduction	1,136,203 96
Freight account	22,239 50
Sundries	131,002 48
Cash on hand at date	119,148 35
	$2,201,628 06

The following are the officers for the ensuing year: Trustees, A. K. P. Harmon, Thos. Bell, Thomas Sunderland, Wm. E. Barron, A. Hayward, Chas. Hosmer, Lloyd Tevis; President, A. K. P. Harmon; Vice-President, Thomas Sunderland; Secretary, W. E. Dean; Superintendent, Isaac L. Requa. During the week ending July 10th, 820 tons of ore were extracted, against 1,050 the previous week. The Blue Wing stope shows an increased yield over that of the previous week of about fifteen tons per day, and the quality is said to equal that of any produced from that deposit. The water is now no impediment to drifting.

Imperial—declined from $123 to $118, rose to $126, then sold at $122@125, and closed at $126. Receipts of bullion for July account, $12,843 37. They have commenced to run a drift north, directly opposite the south drift, and after running north about forty feet, will turn and run west, parallel with main drift. It is proposed to run it within a short distance of the north line. On the 17th inst. no change was noticeable in either drift; made two feet in main and three in north since the previous day.

Kentuck—sold within a range of $369@363, and closed at $370. July receipts of bullion to date, $26,177 25.... Gold Hill Quartz at $75@70, closing at $72. First shipment of bullion, $1,896 18. During the week ending July 13th, extracted 148¾ tons of ore.... Ophir rose from $14 to $22 60, assessment delinquent, and closed at $23. New shaft was 342 feet deep on the 15th inst.—rock very hard and water slack.

Crown Point—advanced from $82 to $92, and at the close sold at $89 50. Receipts of bullion to the 14th inst., for July account, aggregate $12,807 27. The stopee going south between the 700 and 800 levels, are said to be showing very well, but above the 700 it looks less favorable. The principal work is now being done in the south stopes. On the 17th inst., the drift on the 900 level was in fifty feet, and running in soft rock.

Gould & Curry—is in better request, rising from $97 50 to $115, then selling at $107@110 50, and at the close sold at $113 50. The Bonner shaft is now 1,000 feet in depth, and on the 14th inst. they encountered a seam of quartz, with clay, two inches wide, coming in from the southwest. On the 10th, these developments continued to look well. Upon breaking some boulders taken from the South Tunnel croppings, considerable free gold was found, similar to the fine surface rock that used to be taken out of the upper Tunnel in olden times. Average assays on the 13th, gave $42 50 to the ton, and on the 14th, $126 47. The tunnel is now opened so that several men can work, and if the deposit of ore continues, it is thought they will soon be able to extract from twenty to thirty tons of millable ore daily.

Overman—rose from $70 to $89, and closed at $88. They have commenced extracting ore from the 361 level, and it is believed they will be able to take out from forty to fifty tons daily. No pay ore has yet been found on the 500 level. Ore assayed on the 14th inst., showe $30 71 to the ton....Amador pays a dividend of $6 per share on the 20th inst....Belcher levied an assessment of $25 per share on the 13th inst.

Yellow Jacket—declined from $1,275 to $1,155, and closed at $1,222 50. The annual meeting takee place next Monday at Virginia City. It is believed that this company will make a very favorable showing, and we would not be surprised to see the announcement of a dividend before long.

The sales in the Board during the past week have been as follows: Open sessions, $608,596; regular sessions, $1,478,350—total, $1,985,945.

The walls of a china manufactory in Harley, Staffordshire, having become cracked and full of crevices, it was found on examination, that it arose from the fact that the bed of coal under the soil had taken fire. Immense quantities of water was poured on it, but without avail. A similar coincidence exists in Sarrebruck, where the fire underground extends several thousand feet square, and on the surface there reigns a continual spring. Even in the winter the trees remain green, and flowers are frequently found.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, - - - - - $1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PROF. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the *theory*, the latter the *practice* of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools.

To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Swett.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Pelton.*

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Denman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Hermon Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*J. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * Exactly calculated to interest. * * It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Bowie.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times*

Prof. Layres plunges at once "*in medias res.*" He seizes a sentence (which is the unit in composition, whether written or spoken,) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skilfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Marysville Appeal.*

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, $1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Travelling Agents.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

SHER BARSEL MUTUAL AID ASSOCIATION. July 9th. Directors: G. Baum, Charles Groslicht, L. Phillips, S. Guttman and S. May.

EASTPORT, COOS BAY COAL MINING CO. (Oregon). Capital stock, $250,000; 500 shares, $500 each. Trustees: A. Haywood, Q. W. Raymond, J. T. Dean, W. H. Sharp, Oliver Eldridge, L. Stovens and J. L. Pool.

GLOBE G. & S. M. CO.—July 13th. Increase of capital stock from $100,000 to $500,000.

POINT LOBOS AVENUE HOMESTEAD ASSOCIATION.—July 16th. Capital stock, $50,375-divided into shares of $325 each. Directors: A. Mills, J. R. Farish, Henry Mahan, J. W. Nye, C. Railsback, Henry M. Rosekrans and P. H. Blake.

SAN JOSE AND SANTA CLARA RAILROAD CO.—July 16th. Capital stock, $200,000; 2,000 shares, $100 each. Directors: L. P. Van Schaick, A. Pfister, Sam. Q. Broughton, Isaac Branham and John Trimble.

ELECTION OF OFFICERS.—SAVAGE M. Co. Trustees, Alpheus Bull, Thos. Bell, A. Hayward, M. Mayblum, and J. D. Fry: President, Alpheus Bull; Secretary, E. B. Holmes; Treasurer, W. C. Ralston; Superintendent, Chas. Bonner.

GOLDEN RULE M. CO.—July 14th. Trustees, J. H. Turney, J. T. Boyd, W. Bosworth, R. L. Pasteur and E. V. Hathaway; Secretary, J. B. Russell.

SILVER SPROUT M. CO.—July 11th. Trustees, Nathaniel Page, E. B. Mott. Jr., A. Wingard, A. B. Paul and Wm. N. Wade; President, Nathaniel Page; Secretary and Treasurer, T. B. Wingard.

SULPHURETS;

How Concentrated;
And How Worked;

With a Chapter on the

BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v13tf

Mechanics' Fair Daily Press.

Having received permission from the Mechanics' Institute, we shall print the

Third Volume of the Fair Daily Press,

in the Grand Pavilion, during the approaching Exhibition, which opens on the 8th day of August, 1868.

Our publication of the DAILY PRESS, in the Pavilion in 1864 and 1865, met with marked success, rendering ample satisfaction to its patrons and numerous visitors attending the Fairs. We are now confident that, with improved facilities, experience, and active efforts, the present volume will be made still more attractive and useful for the increased thousands who will visit the Exhibition, and receive, gratitously, each issue

Fresh from the Press.

New and interesting features will be adopted. Each number will contain a large amount of sprightly local matter, together with much permanently valuable reading.

A limited portion of the paper will be allotted to a choice class of advertising, furnishing a favorable opportunity such as is rarely met with. Following are our uniform

Rates of Advertising:

One column during the Fair	$260 00
One-half column during the Fair	130 00
Per line (space of small type) during Fair,	2 00
Per line, 10 lines or more, during Fair	1 75
Per line, 30 lines or more, during Fair	1 50
Per line for single insertion	25

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form; we will otherwise assist advertisers in getting up their notices, when desired.

Notices of the Press:

Following are a few of the many compliments paid the previous volumes of the DAILY FAIR PRESS:

THE SCIENTIFIC PRESS proprietors strike off and give away thousands of their little sheet, entitled THE MECHANICS' FAIR DAILY PRESS. There were great crowds all the evening about the telegraph and the presses, many of whom had their first sight at the practical working of these great motors of civilization.—*S. F. Evening Bulletin, Sept. 7, 1864.*

SCIENTIFIC PRESS.—A printing office has been established at the Mechanics' Fair, and Messrs. DEWEY & Co., the enterprising publishers of the MINING AND SCIENTIFIC PRESS, are issuing from it a handsome double-sheet daily, which is a credit to themselves, its editors, and to the Fair.—*S. F. Morning Call, Sept. 8, 1864.*

THE MECHANICS' FAIR DAILY PRESS is the title of a very neat quarto paper published at the Industrial Fair Pavilion, by DEWEY & Co., of the MINING AND SCIENTIFIC PRESS. It reflects great credit, as does the weekly, upon the enterprise and ability of the publishers. We want it regularly.—*Reese River Reveille.*

Parties who intend to advertise will do well to subscribe at once for the amount of space wanted.

DEWEY & CO.,

Publishers of the MINING AND SCIENTIFIC PRESS, Patent Agents, Book and Job Printers, corner of Clay and Sansome streets, San Francisco.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, July 17, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.		Per ton.
12 per cent. ore	$16 00	22 per cent. ore	$43 56
13 " "	18 62	23 " "	46 45
14 " "	20 20	24 " "	49 33
16 " "	23 35	26 " "	52 22
16 " "	26 23	26 " "	55 11
17 " "	29 12	27 " "	58 00
18 " "	29 91	28 " "	60 89
19 " "	34 90	29 " "	63 77
20 " "	37 78	30 " "	66 66
21 " "	40 67	31 " "	69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, July 4th: Arnold & Morris will start work on the Leviathan soon.

The Globe Co. are having the front of their new tunnel timbered.

Chronicle, July 4th: Gypsum is found at Markleeville, Alpine and Silver Mountain.

San Francisco *Times*: A correspondent writing from Bullion under date of July 10th, says: The Mount Bullion Co. are running a tunnel to cut the Union, two Eastern Slopes, Mount Bullion, Star of the West, Red, White and Blue, and Highland Mary lodes, any one of which gives good assays from top rock. The whole length of the tunnel to cut the Highland Mary lode will be about 4,500 feet, at which point the depth will be 1,200 feet. The distance to the Union ledge is some 900 feet, and the depth at that point is between 500 and 600 feet. The tunnel is being run by contract, with three shifts of men, who average 60 feet per month. The company owns the water front along the river for 1,800 feet above the mouth of their tunnel, which gives them a fall of 28 feet ten inches, with the control of from 3,000 to 4,000 inches of water at the lowest stage of the river.

The Monitor Consolidated Co. is located a half mile below, on the east bank of the river, and on the north side of Monitor creek, and their tunnel runs nearly parallel with that of the Imperial Co. The whole length of their projected tunnel is about 6,000 feet, with a depth of over 1,600 feet. They will cut the Union and Eastern Slope leads in addition to those cut by the Imperial Co., and when completed will be in the same remarkable formation as is the Tarshish mine, and some 700 feet below the lowest workings of that mine.

Amador County.

Ledger, July 11th: James Ruth has discovered a vein of steatite (soapstone) on the ranch of Van Dusen, near Newtonville, of great purity, and in large quantity. The veins of soapstone in the mountains above, usually contain so much iron as to be nearly useless for building purposes. This vein is without iron, uniform in color and of fine texture, and easily worked.

Jackson *Dispatch*, July 11th: We were shown a large chunk of solid gold, on Wednesday last, weighing a fraction less than 14 ozs., and valued at $228, which was taken out of a claim near the Gate, about one mile from this place, on the day previous, by a party of Chilenos.

Kern County.

Havilah *Courier*, July 4th: The Anaconda lode, in the New El Dorado district, and situated on the same range of hills in Kelsoe Valley as the Esperanza or Italian lode, has a tunnel run on it about 80 ft. or more, showing a solid well-defined lead 2½ ft. thick, of precisely the same character of rock and equally as rich, and by many thought to be richer than the Italian lode. Work is being prosecuted on the lead and the owners contemplate putting up a mill as soon as the lead is sufficiently developed.

. . . The St. Paul is a lead lately discovered by Jas. A. White and F. Fanning. It has not yet been worked to any extent. Three or four cuts have been run into the hill at different places on the lead, showing a lead about six inches thick and widening out—the rock prospects very evenly and very rich, and is pronounced by all who have seen it to be the richest rock yet discovered in the district, with the exception of the Rogers & Keeney lead. The owners are preparing to commence work in a very short time, and will put up arastras to work the rock for the present. These leads are very eligibly situated, being within a few hundred yards of a fine stream of water sufficient to run a mill with an abundance of timber close by—all that is necessary to carry on operations successfully. Other leads have been discovered near these, and are being opened by the discoverers, which promise well.

Mariposa County.

Mail, July 10th: A correspondent writing from Hite's Cove on the South Fork of the Merced river, says the new mill of Hite & Co is rapidly approaching completion, and will run 20 stamps.

At the Lafayette mine, owned by D. Ghirardelli, of Oakland, a vein was struck 18 in. in width, that will pay from $30 to $40 per ton. Crushing to commence soon.

Gazette, July 10th: Hugh Diamond has purchased John Flannigan's interest in the mine owned by Flannigan & McKee, near Coulterville. The mine has a shaft nearly 200 ft. in depth. The mill is a first class mill with eight stamps for a battery. We were shown some specimens taken from the shaft which showed free gold, and if they have much such rock it will yield a good income to the owners.

Nevada County.

Gazette, July 9th: A gentleman informs us that a number of men are engaged on the South Fork of Poorman's Creek in gathering float rock left there years ago by placer miners. They have about 300 tons piled up ready for hauling and crushing. This rock is said to yield from $15 to $30 a ton. Palmer & Everingham's custom mill will be ready for work in about 60 days.

July 13th: The North Star Co. had employed last month in their mine and on the ground above, 208 men. This is the largest force employed in any mine in the county. The North Star is opened in better shape, and more extensively, than any other mine in the State, which enables them, although the vein is not large, to employ a large force, and take out a large quantity of ore. A dividend was recently declared of $15,000, amounting to $5 a share.

We learn from Messrs. Coleman and Crittenden, owners in the Nebraska cement claims at French Corral, that their cement mill is completed, and it is their intention to commence crushing to-day.

Transcript, July 10th: The miners of Moore's Flat are piping away with a tremendous pressure of water, and a large range of gravel will be washed out this season. Hickey & Co., near town, are running 400 in. of water with a pressure of 200 ft., and have excellent prospects for a good yield. Many other companies in the vicinity are doing first rate.

July 11th: Cozzens & Atkins, the purchasers of the Gardner hydraulic claims at Little York, have already commenced work. One set of claims started up on Monday, and another will be put in operation next week. The ditches belonging to this property are now running about 1,000 inches of water, all of which is being sold to the miners at Little York and Gold Run.

July 12th: For some time Union Hill has been very dull, but lately a new start has been made in mining matters. Some of the claims are at work, and two others will start next week.

July 14th: The miners in the vicinity of French Corral are doing first rate. Several mills are in operation, crushing the cement. The Nebraska Co., which built a mill some time since, is paying well, and it has been proved that the reduction of cement by mill process, is profitable.

Grass Valley *Union*, July 9th: The Idaho Co. are about erecting a 15-stamp mill near their hoisting works. The Idaho rock is looking splendid, and there is no doubt but with their own mill the stockholders of the company will soon realize a fortune.

July 14th: Engineer McDermott, of the Empire mill, of this place, went below yesterday to superintend the building of a new engine, the largest and finest one in the State, which is used for mining purposes. New pumps are also to be put in when the Empire will be all right for fifty years to come.

Ennis & Co., of Red Dog, after a three days run, cleaned up $420, seven men having been at work. This makes the handsome average of $20 a day to the hand. The Brown Bros. of You Bet, after a run of 21 days, cleaned up $6,000.

Gazette, July 15th: The original owners of the Sneath & Clay took out of the mine nearly $200,000, half of which was clear profit, over and above the expenses of erecting the mill and hoisting works. The mine paid during the time it was worked by the New York and Grass Valley Co., and the suspension was occasioned by mismanagement in failing to keep the "dead work" ahead; and partly, perhaps, by the heavy expense incurred by the Co. in erecting hoisting works and opening the Union mine, which has thus far proved a dead loss.

The North Star at Grass Valley, are now engaged in putting two additional batteries, of four stamps each, into their mill. With this addition, the mill will have twenty-four stamps, all of which will be running in the course of two or three weeks.

Plumas County.

Quincy *National*, July 11th: Banks, Goodwin & Co., have struck rich diggings at the forks of Hopkin's Creek, and last week they took out $480. Trucks & Co. are making one ounce per day to the hand. Henly & Co. are getting fair prospects in the Blue Lead.

Union, July 11th: On Hopkin's Creek, Betts & Co., McManus & Co., and Holloway & Co., all on the same lead, are getting big pay. The ditch will supply them with water to work the whole year. The diggings are very extensive, and have paid from the commencement. Barnes & Co., above Hopkins, are working with a hydraulic; they have *picked* up about two ozs. per day for the past month; they will make a big clean up. Cox & Co. are also getting big pay. Several of the drift claims are also paying good wages.

The Bull Frog quartz mill on Rush Creek, which is now owned by McClellan, Bidwell & Co., is running, and averaging about $100 per day.

The Eagle Co. finished cleaning up on the 28th ult. The company took out something over 1,300 ozs., or about $24,000. They have commenced work again and are taking out pay dirt. The Buckeye claims are averaging about $6 per day to the hand.

The Mountaineer Co. are still running ahead with their bed rock tunnel, and are in hopes of striking pay grit during the fall.

All of the ditches are full, and the hydraulic companies at Richmond Hill are still at work piping.

Sierra County.

Downieville *Messenger*, July 11th: A correspondent says: Mr. Gallatin in Sackett's gulch, near Little Table Rock, has made another rich harvest of gold. I understand that he cleaned up about $20,000 for this winter's drifting, with from four to ten picks. Wolf & Bros., next adjoining his claims, have been running a new lower tunnel towards Little Table Rock, and have been rewarded for their energy and zeal in finding good pay gravel improving as they go along. On St. Louis Flat is the Western Co., taking it out as big as usual. Morgan & Co., with their piping apparatus are working very rich gravel. McCrory is piping dirt which is the best looking in this vicinity. Emory & Pharr are piping two sets of claims. In one of them, they are caving down banks of pipe-clay to slake during the summer, so as to wash the same away more readily next fall. At Greenwood is the Star Co., formerly known as the Greenwood Co., under the superintendence of Evan Jones, taking out big wages as usual. At Cedar Grove the claims are paying good wages. Next to their claims are those formerly known as Deacon Long's claims, which the present owners propose to open very soon by blasting the tunnel lower and taking out the shute. Next to this claim are McCrory's piping claims, dirt looking well. At Gardner's Point is the Old Comet Co., driving a new tunnel or gangway around a cave. Isaman & Co. are piping very rich looking dirt, but hard as iron; they washed off about four claims. Next towards Grass Flat comes the Riffle Co., booming away at hard rock of the celebrated lightning description, and in the new town of Grass Flat is the extensively known Pioneer Co. drain tunnel and claims also hammering away in their branch tunnel towards the former. The Northern Liberty ground, having overhead good looking and fair prospecting gravel, expect to wash very soon. This Co. has so far expended over $40,000 in hard $20 gold pieces in prospecting their work, and will give in course time employment to several hundred men, and will afford drainage to the Bamboo, Dame Fortune, Maria Hartman, Homer William, Homestead, and Manzanita, now called the North Star, and the New York Cos., so as to work their extensive and rich ground with good advantage and success. The claims at Port Wine are paying as well as usual.

Siskiyou County.

Alta, July 15th: A dispatch dated Yerka, July 14th, says: The party who left this place some months ago, on a prospecting tour to the Stickeen and other northern streams, report the country barren and destitute of deposits of gravel. No discovery of gold was made anywhere.

Tuolumne County.

Sonora *Democrat*, July 11th: Hiskey, Mienhard and Morton, after a run of seven days, at the Star mine, cleaned up the batteries of their mill and obtained $960. These gentlemen have purchased the Star mine of P. B. Bacon. It is the best lead in the Southern mines.

The proprietors of the Hines claim at Columbia, picked up a lump of gold last week worth $5,500.

Yuba County.

Marysville *Appeal*, July 11th: A correspondent writes that the prospects of the Pennsylvania claim, Brown's Valley, have never before been brighter than they are at present. The Co. are hoisting very good quartz from both their inclines, and it will be easy for them to supply their 16 stamps without any further interruption. In incline No. 2, the Co. have again found their rich pay chimney—what so far had been taken for a hanging wall is now found to be simply a new splice of the chimney, as large and rich as ever before.

ALASKA.

Portland (Oregon) *Evening Bulletin*: From accounts brought by some officers of the U. S. steamer Jamestown, which recently arrived at Esquimalt from Sitka, we learn that a strike has been made on Takou River, about 70 miles northeast of Sitka. It was made by a party of miners from the Steekin, who are not satisfied with the result of their labors in that section. The prospects on the Steekin are spoken of as much better than ever known before, some large pieces of gold being recently taken over to Sitka.

BRITISH COLUMBIA.

During the month preceding June 20th, $213,772 in gold dust and bars were shipped from Victoria to San Francisco. Nearly all of this gold was taken from Cariboo mines. The mining prospects in the upper country were never so good as at present.

June 27th: An important strike has been made on Antler Creek, Cariboo. It has caused considerable excitement, and it is thought that it will again come up and equal its palmiest days. Accounts from all portions of the gold diggings of Cariboo are of the most favorable character. The bed rock drain has been thoroughly tried, and may now be considered safe for this season.

Steamer Lillooet came in last evening from Yale, bringing $650,000 in dust from the upper country.

COLORADO.

Georgetown *Miner*, June 25th: Work on the Astor lode has commenced for the season. Mr. Morse, who owns 400 feet on the vein, is now running a set of hands, and will work the same actively until near the close of the season, when the necessary buildings for winter mining will be erected, and the work in the mine continue uninterruptedly throughout the year. The first class ore taken out will be reduced here, and the second class, with the leaner material, will be piled up for future reduction. Messrs. Cooper & Fisher, who, with Mr. A. T. M. Adams, own the balance of the lode, are actively engaged upon their portion of the property. Much of the material in the Astor lode which has heretofore been deemed worthless, is found to be rich in silver. Mr. Martine made an average assay of the sand in the crevice, many tons of which had been thrown away, and found the same to yield $55 per ton, silver. An assay from a fine specimen of the ore by the same gentlemen, gave the enormous yield of $18,000 per ton.

Denver *News*, July 1st: The Hayden and Morrison mills at Graniteville, will be running this week.

The Amazetti, an extension of the Yankee Blade, is worked extensively; the quartz looks well.

The gold business at the Denver U. S. Mint is improving. Yesterday they paid out 22 bars of gold bullion, valued in coin at $13,627.51.

Hol. Newlin came down on the semi-weekly Buckskin coach yesterday, which brought also about 150 ounces of gold. The Hamilton Placer Mining Co. have leased their mine to Foster & Poles, for 40 per cent. of the gross proceeds. The mine is well opened and has three hydraulics in operation, which are fed by a ditch 1¼ miles long. The ground lies along Tarryall Creek for 1¼ miles, and they are now at work 400 to 500 feet back from the stream. The prospects of the other placer mining companies in the Park are encouraging.

At Hussey & Co's, yesterday, we saw 40 ounces of retort from the Ni Wot Co's mine. At the First National were three bars of bullion weighing 160¼ ozs., and valued at $3,000 in coin. At the Colorado National were two bars weighing 71 ozs., and valued at $1,300.

Central City *Herald:* Dr. Holland, of Trail Creek, got $1,216.16 from one cord of Coyote ore with stamps. The Lincoln Co., of Mill City, are running eight arastras and making it pay. Within two weeks there will be 20 arastras running at Mill City. The ninth lode has been cut by the Quartz Hill Tunnel, now 350 feet in. Six men sluiced five days on the Wright claim below Idaho, and cleaned up 79 ozs.—$60 a day to the hand. The Pleasant Valley Co. realized $1,700 from six day's sluicing. There are 18 companies sluicing in Russell Gulch, employing 150 men.

Chieftain: The Moreno mines are beyond cavil a great success—if $8, $10, $15 or $20 to the hand per day may be termed success. There are already some 5,000 persons in the mines, and the number is increasing daily.

Register: The Clarke-Gardner Co's mine is furnishing the Black Hawk 60-stamp mill with ore. This is one of the mines that has yielded nothing for two or three years. The Flack is another. They have been since February getting out the water, and now the mine is ready to produce ore. There are running in Black Hawk 324 stamps, besides the smelting works, and the California

reducing works. Patch diggings have been discovered and are paying well on the hill side below the Burroughs. The Equator lode, Georgetown, is now open to a depth of 102 feet. The average width of the vein of paying ore is two feet, one foot first class. They have struck the lode in a new shaft 200 feet east of the discovery, and there have three feet of sulphide ore.

Herald: Herrick has got out another silver button, weighing 211 pounds, taken out in 30 hours (expelled we suppose). Five companies are sluicing on North Clear Creek. Robert Teats presents at the bank 215 pounds of silver, taken by his California works from ore from the May lode, Mountain House District.

DACOTAH.

The accounts from Sweetwater are conflicting. Our readers must judge for themselves.

Grass Valley *Union:* A correspondent writing from Brownsville, North Platte, under date of June 9th, says: I left Salt Lake on the 21st of April, and arrived at the Sweetwater mines on the 21st of May. I only stayed there three days, but before I was there two hours I was convinced that it was no place for me. There are some gulch diggings, but they are mostly dry, with no ditches cut to them, and the ledges have not a shaft sunk on them.

Sweetwater Mines, June 17th: P. A. Gallager (formerly of Calaveras county) left us yesterday for Salt Lake City, carrying some $15,000 in gold dust, the proceeds of our much abused placer claims. This makes over $20,000 shipped this week, and yet but few claims thus far have been opened.

Oakland (Cal.) *Transcript:* Mr. Hemphill writes from Salt Lake under date of June 22d, that Sweetwater is overdone, and many returning prospectors pronounce it a failure. The ledges are proving to be mere spurs and soon run out, though some of them are very rich in gold. From three gunny sacks full of the decomposed quartz of one ledge, $1,200 was taken; hence the present excitement.

Cheyenne *Leader*, June 24th: Mr. McGlinchy arrived here to-day from Sweetwater, and says the placer diggings are really good and improving, while the quartz is beyond all question the best which has been found anywhere.

25th: Dr. Irwin and A. O. Libby have returned to Cheyenne from the mines beyond the Laramie. They report snow to the depth of six to ten feet. Placer diggings good, and the country abounding in ores of gold, silver, bismuth, lead and other metals.

Mining prospects and results are growing better every day. On Rock Creek about four miles from South Pass City, they are making from $10 to $12 per day to the hand. In the Pacific district they are doing quite as well, and in Spring Gulch a ton is in use from which they daily clean up from $150 to $180. Comstock, of Washoe fame, is making $100 a day. One man has here obtained from five pans of dirt, in a locality where the ground can be easily worked.

29th: In grading the road near Rock Creek, a cut was made through a vein of the finest quality of bituminous coal eight feet in thickness. Railroad men say that in a few months all the coal used in Omaha west of this road will be taken from mines on Laramie Plains, instead of being shipped from the East as at present. This coal is said to be far superior in quality to that now in use on the road.

IDAHO.

Lewiston *Journal*, June 20th: A correspondent writes: There are four arastras crushing ore from the Davis lode, at Florence. After one month's run they have cleaned up $4,000. About 50 ozs. of retorted gold amalgam has been sent to the San Francisco mint for assay and coinage, so that the proprietors of the ledge may have a correct valuation of the proceeds of the Davis lead. The arastras are now progressing finely. The working of the ledge has been this season, by an incline shaft, and the crushing entirely by the arastra process, for a thorough prospecting purpose. The company that own the ledge are now fully satisfied of its richness and permancucy, and are calculating upon obtaining a mill so soon as they can do so and have it run unincumbered by debt; this they expect to do from the proceeds of the arastra which they have now at work.

Owyhee *Avalanche*, July 4th: The Rising Star Co. are engaged in erecting their steam hoisting works. The ore now being taken from the mine shows large quantities of black sulphurets and beautiful ruby silver. Mr. Sandborn has sent ten tons of average ore to Virginia City, Nevada, where it will be worked and tested by the chloridizing process. Eve's sawmill is turning out lumber for the 30-stamp mill to be erected this summer.

Active preparations are in progress for extensive mining operations on War Eagle and Oro Fino mountains this summer. The splendid hoisting shaft on the Poorman will soon be completed, when a large number of men will be employed and a large amount of ore taken out—probably more than enough to keep the Owyhee mill in constant operation the year round.

An experienced mining Superintendent, recently from Virginia City, Nevada, has taken charge of the Golden Chariot mine. The new hoisting works are on the ground, and will be ready to steam up in 8 or 10 days. Mr. Hyde continues foreman in the mine.

Large quantities of fabulously rich ore continue to be taken from the Ida Elmore, although the mine cannot be worked any deeper till the arrival of the new engine, which will be in about two weeks. The small engine now in use will then be set to work on the Surplus Oro Fino.

We are informed that the Oro Fino hoisting works will be in working order to-day. Owing to the anxiety of the company to get to work, the engine has been put up in the open air, but will be inclosed in a suitable building immediately. Mr. Patrick McMahon, an energetic and experienced miner, is now foreman of the mine.

A thousand ft. of the Mississippi ledge has been bonded to Harvey Johnson, for 90 days, and work was commenced last Monday in order to thoroughly prospect it. The vein is over seven feet in width, and is, no doubt, one of the largest and most valuable in the camp. Should it not pay more than $40 per ton—a low estimate—it will yield a handsome profit.

Clark & Basford have commenced work on the Greenback mine. A shaft is down on the ledge 40 ft., 75 or 100 yards a little west of north of the new shaft now being sunk on the Poorman. The vein shows a width of from 8 to 10 inches, and somewhat resembles Poorman ore.

Three tons of Rapidan ore, crushed in an arastra at Ruby City, yielded over $70 per ton.

The Rising Star mine, in Flint District, is yielding very rich ore.

World, July 4th: The tunnel into Banner ledge is pierced to a depth of 300 feet. The ledge is one foot width at surface, and wide as it exteuds to two feet in thickness at the bottom of the shaft. The ore taken from the ledge is very rich, and in the absence of more suitable machinery for crushing, Messrs. Bradford & Carr have an arastra to work upon it. The Banner mine is one of the best in the Territory, but because of a succession of adverse circumstances attending its management in former years, its development has been retarded.

MONTANA.

Helena *Post*, June 26th: The new 10-stamp mill of the Cole-Sanders Co. is to be placed upon the celebrated Poor Man's Joy lead, at Phillipsburg, and large quantities of ore are now being taken out.

During Wednesday and Thursday last, Molitor Bros. melted and assayed half a dozen golden bricks, weighing respectively, as follows: 330 ozs., 310 ozs., 272 ozs., 400 ozs., 383 ozs., and 262 ozs., or over 163 pounds of solid gold, worth over $35,000.

The last run of the Union mill, of six days, yielded a brick weigbing 307.96 ozs., .779⅓ fine, and worth $4,960.70.

At the First National Bank assay office, during yesterday and the day before, Prof. Steitz smelted over 1,000 ozs. of the precious metal, worth $18,000.

One of our bankers has shipped half a million dollars worth of golden bricks to the States during the past six months.

The Green-Campbell ledge, Silver Star District, has several shafts on it, and is developed to a depth of 82 feet, with a clear crevice of 10 feet of pay quartz. Levels have been run, and over 3,000 tons of quartz are now on the dump piles, estimated at $25 per ton.

After a four month's run "Pony Ricker" has just given his mill a thorough cleaning. The result was 207 ozs. of amalgam, worth nearly $4,000.

At Jefferson Gulch, Marsh & Co. have run a flume 900 feet in length at the lower end of the gulch, and are now within four ft. of the bed rock. At the upper end of this flume, prospects of from 25 cents to $2.50 to the pan have been obtained. Darab, Harris & Co's claim cleaned up on Saturday night 47¼ ozs. of gold for one week's run with seven men. Other claims are yielding from $16 to $20 per day to the man.

Numbers are leaving Radershurg for the new Crow Creek mines, where prospects of as high as $1.50 to the pan are reported.

At the assay office of F. Bobm, on Saturday, 1,293 ozs. of gold were run into bars, worth $25,000.

July 3d: In Moore's Gulch, at the head of Elk Creek, one man took out alone during two days last week, $108 and $138 respectively. The bed rock flumes in Elk Creek are all paying well.

The mines at the head of Ten Mile are proving rich. Three companies, among them that of James and William Pierce, are hydraulicing there with good results. Runs of from $25 to $30 per day to the hand are said to be not uncommon.

The Southern lode, situated in Spring Gulch, a tributary of Oro Fino, is beginning to attract considerable attention. It prospects from ten cents to one dollar to the pan of dirt. The character of the rock is decomposed quartz, and the ledge is from one to three feet in width. A shaft has been sunk to the depth of 70 feet, and some 50 tons of quartz taken out ready for working. An arastra now being put up near it, will be completed next week.

Mr. F. Bohm informs us that the assay business is at least 25 per cent. better now than it was last spring. Up to the present time he has already assayed, during the present month, $200,000 worth of gold. He yesterday assayed 1,000 ozs. of the precious metal.

The ground in Last Chance Gulch below the Whim claims, or such of it as is owned by white men, is paying well. Six companies are working it and are making from $6 to $10 a day to the hand.

In its mining operations, Radersburg is still very successful. On two occasions recently, Messrs. Barrett, Waltou & Co. have cleaned up from their claim in Charity Bar, $237 for a ten hour's run with two men working. They have also four yields, $218 and $150 per day with the same number of men. All the Charity Bar claims are paying well. Nearly all of those that went on the stampede to the new diggings at Wilson's Creek, have returned. Granite Bar, on Keating's Gulch, near Radersburg, is yielding well. The first run was made there on Monday last, when four men cleaned up $190.

A correspondent writing from Springville, June 22, says: There are 9 hydraulics running here steadily, day and night, giving employment to about 100 men. About 101 claims of minor importance are being worked on Cedar, Coate's and Oscaloosa gulches, and are paying fair wages.

The claims of Judge Stewart & Co., which are worked by hydraulic process, are paying extremely well; they having cleaned up $1,000 while cutting through the rim rock, in order to get their flume low enough to work the ground in the rear, which they consider much better than that in front. Sheafer & Co., on the bar adjoining, have cleaned up $700 in a run of 48 hours. Logan & Co., who recently purchased the hydraulic claim of G. Bowman, have made, it is said, a good bargain. Jake Anthony is running his ground lively, and is doing well. Ross & Co. have a number of men at work on the same bar, in which J. W. McCone is largely interested.

NEVADA.

Esmeralda.

Aurora *Union*, July 4th: Governor Blasdel's son has been making arrangements for refitting the Homestake mill, and he intends sinking immediately 100 ft. deeper on the mine.

There has been taken out in this vicinity, and shipped through Wells, Fargo & Co's Express, during the month of June, over $10,000.

The proceeds of a crushing of 13 tons, from the Pacific at Bodie, amounted to $3,100.

Territorial *Enterprise*, July 10th: Mr. J. Cooper yesterday brought to this city some exceedingly rich rock from the Central, a southern extension of the famous Wilson lead, Pine Grove, Wilson District. The specimens we have seen are plentifully besprinkled with spangles of free gold, and the Central Co. have out upon their dump about 20 tons of the same sort of auriferous filth, with a large ledge from which to dig out more when they want it.

Humboldt.

Reese River *Reveille*, July 3d: Mr. Pickett informs us of the discovery of rich silver ore on Long Creek, in the northern part of the Battle Mountain district, eight miles north of the Humboldt River. A large vein called the Little Giant has been traced for upwards of a mile, and three locations of 2,000 feet each have been made upon it. The ledge outcropped at the summit of a hill and was easily followed into and across a deep cañon. One of the claims, owned by Fox and Macbeth, has been worked to some extent, and lately 4½ tons of ore were sent to Fall's mill, at Unionville, some 60 miles from the district, for reduction, and it yielded $192 per ton. As the mill crushes the ore wet, it is not probable that over 50 or 60 per cent. of the silver was extracted and saved. Besides the Little Giant, several other ledges were discovered and located, all of which show ore rich in silver. At the greatest depth opened in the Little Giant, the vein is said to be five feet thick, compact and well defined. Scattered over the district there are about 50 men engaged in mining and prospecting. The best copper ledges are in Copper cañon, about eight miles south of Long Creek, but at present nothing beyond assessment work is done by the owners.

Reese River.

Reese River *Reveille*, July 7th: Yesterday a vein of handsome ore was struck in the works of the Plymouth Co., a specimen of which we saw to-day at Paxton's hanking house. The vein was cut in a drift extending from the shaft at the depth of 250 ft. We did not learn the width of the ledge, but there are pieces from two different strata each of which is from two to three inches thick. One stratum is beautiful dark ruby ore of apparently a high grade; while the other appears to be a dark rich sulphuret. The shaft of the company is designed to pierce several ledges belonging to it, but whether this is one of them, a blind ledge, or the ledge of some adjacent company, is at present a matter for conjecture.

Silver Bend *Reporter*, July 8th: After a thorough overhauling, the Combination mill started up on Monday, and probably will not cease its hammering again for the next 50 days. It has 20 stamps at work wet crushing and 20 dry.

The little 10-stamp mill at Hot Creek has "shut up shop," we learn—not being able to either procure ore or treat it successfully. Mr. Miller will immediately rebuild the Old Dominion, and will probably have it at work by the middle of August. A new discovery is reported of a ledge half way between Hot Creek Cañon and Rattlesnake, by Mr. Frame.

A depth of 48 ft. upon the vertical shaft yesterday disclosed a fine body of ore in the Silver Queen mine. As the ledge has not yet been cut through it is impossible to determine its extent at this time, though if we can judge by previous surface developments and surroundings, the Silver Queen will prove to be one of the best lodes in the district.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Territorial Enterprise, July 9th: The Yellow Jacket mine is looking better than it has for many months and all the machinery about their works is in good repair.

The Crown Point Co., Gold Hill, have commenced a new drift, south from their shaft, at the 900-ft. level.

The Imperial and Empire Cos. are still battering away at their respective drifts on the 900-ft. level. The drift of the Empire Co. is over half way through the ledge, and thus far has developed nothing of any very encouraging nature in the way of pay ore. The Imperial drift still continues in barren quartz, but a side drift has been commenced to follow the little seams of pay ore found just after cutting through the east wall of the ledge.

July 11th: Wells, Fargo & Co. shipped during the past week from their offices in this city and Gold Hill, 7,124 lbs. of assayed bullion, valued at $218,377.64.

The Alpha Co. are still engaged in repairing their shaft, retimbering their more important drifts, and doing other necessary work with a view to taking out ore shortly. Many of the old drifts are so badly caved that no effort will be made to open them; it being considered safer and cheaper to open such as will be needed in new and unprospected ground. The reopening of the mine has proved a much more arduous and expensive task than was anticipated. Once it is again in order, however, there will be no water to contend with, and the company have two good bodies of ore upon which they can at once set to work.

July 12th: The total amount of bullion shipped from the office of Wells, Fargo & Co. in this city, during the month of June, was $960,501.92; and from their Gold Hill office for the same period, $505,533.05. The shipment from Gold Hill was about $110,000 less than the shipment from the same point for the mouth of May.

OREGON.

Dalles *Mountaineer*, June 27th: A correspondent writes that the diggings on Canyon Creek are still paying well, employing a great many hands at good and remunerative wages. At Marysville, or in that district, the boys have fair prospects of a rich yield of the "shiny ore."

Times: The Humboldt Co., at Eagle Creek, cleaned up after a two week's run, and took out $1,100. Their ledge, (the Gem) is increasing in width and richness.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

San Francisco:

Saturday Morning, July 18, 1868

Notices to Correspondents.

L. B.—Attraction may be regarded as acting both at *sensible* and *insensible* distances. In the former case, it is called *gravitation*. It is the power by which substances are propelled towards the earth; it exists in all known forms of matter; it acts directly as the mass, and inversely as the square of the distance; restrained by *inertia*, it maintains the planetary bodies in their orbits, regulates their movements, and tends to confer upon the system of the universe that consummate harmony which Newton first unveiled. At insensible distances, attraction is also exerted. It is by this property that the form is preserved and the texture of solids is modified; it gives a spherical form to fluids; causes the adhesion of surfaces; and influences the mechanical character of bodies. The different forces with which it is exerted are exhibited in the different qualities of solids, which are sometimes exceedingly hard and of difficult diversion, as the diamond, rock-crystal, etc.; others are comparatively soft or brittle, and exhibit less force of aggregation, such as calcareous spar, chalk, etc.; in others the property is so modified as to exhibit plasticity, porosity, elasticity, and tenacity, as seen in clay, sponge, caoucthouc, steel, etc.

A LEARNER.—You may easily acqnire the habit of accurately describing, in a separate manner, the chemical and physical character of bodies, by closely adopting the following rules: Physical properties are independent of the action which any body exists upon another body; chemical properties relate to the action which occurs when brought into contact with another body. For example,—when describing the physical properties of a substance, say sulphur for instance, reference should be made to its brittleness, its faint peculiar smell, yellow color, crystalline structure, its semi-transparency, the facility with which, if rubbed, it exhibits electrical attraction, and so on; but if it is desired to describe its chemical properties, it will be necessary to allude to the changes which take place on losing the distinctive properties alluded to, such as the ease with which it takes fire, and rapidity with which it unites with silver or copper, especially when heated; its insolubility in water or alcohol, and its solubility in turpentine or alkaline liquids.

OROGRAPHER. — Viewing the subject of mountain ranges, as an associated geological and geographical subject, we may assume that the two longest ranges in the world consist of the Andes, commencing at Terra del Fuego, extending north through South America, and continuing through Mexico and the United States (as the Rocky Mountains) to Mackenzie river,—total length being probably 8,400 miles. The other great range is in the old world, commencing with the Meling Mountains, China, near Amoy, continued westerly by the celebrated Himalayas, the Hindoo Koosh, etc., to the Asiatic side of the Dardanelles; on the European side this mountain range continues through Turkey in Europe, and terminates on the borders of France and Switzerland. This chain forms a length of about 8,000 miles; although less in length, the mass of matter composing the latter is probably more than double that of the former.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

J. Ross Browne's Report.

The final report of Mr. J. Ross Browne, upon the Mineral Resources of the Pacific Coast, the reception of which we have already acknowledged, is really a valuable publication, and contains a large amount of information relative to the vast mining region which he was instructed to examine and report upon. The facts themselves were too voluminous to be very carefully digested within the time allowed the Commissioner to make his report, or to be presented under any circumstances, in a form specially attractive to the general reader; yet they are facts which it is highly necessary should be brought together and placed before the public in a convenient form for reference. We believe there is no special originality claimed for the work; and it may not be one which will particularly instruct or interest a well informed California reader; but it conveys just the class of information that every Californian should desire to see spread before the masses of the Eastern States and Europe.

This, as well as Mr. Browne's first report, has been slow in reaching this coast, and, indeed, we presume it has not been the intention of the government, nor is it particularly the desire of the people of this coast, that it *should* have a very general circulation here. The object of its publication will be far better attained by giving it such a distribution in other longitudes than this, where it is for our interest more should be known of our resources than has yet been promulgated, with anything like an authoritative stamp.

The preparation of this report has been a work of no ordinary magnitude,—considering the time allowed for the same,—and although Mr. Browne has gathered a large portion of the material by his own individual observation and industry, it has nevertheless been an absolute necessity for him to call to his aid much assistance from experts and others whose personal standing in the community, long residence on this coast, and intimate acquaintance with our various resources and industries, has enabled them to furnish information in their respective specialties, which will be received as correct and reliable. Hence the report is by no means the result of the labor of any one individual; but comprises the aggregated result of the labors and observations of numerous diligent explorers, statisticians and experts, continued during many years of active research on this Coast. The Commissioner has awarded very generous credit to his able corps of assistants, in which he remarks: "If there be any merit in the work, it belongs chiefly to my colaborers, who have devoted themselves with such unselfish zeal to the promotion of the objects designed to be accomplished by this Commission." He gives credit to Mr. J. S. Hittell, of this city, for the description of the chief portion of the mining regions of California. Dr. Henry De Groot, of this city, Mr. T. H. Rolfe and Mr. E. F. Bean, of Nevada, and Dr. A. Blatchley, are also referred to as contributors in this department. The latter gentleman, who is well known as an experienced mineralogist and mining engineer, was also especially deputized to visit and prepare, from personal observation, the report upon the mineral resources of Montana and Idaho.

Mr. H. C. Bennett, now Secretary of the Labor Exchange, of this city, and a gentleman well acquainted with the mineral resources of the State, is credited with the authorship of the chapter on Copper and the Miscellaneous Minerals, of which paper Mr. Browne says: "No such complete and extended notice of the miscellaneous mineral productions of the Pacific Coast has yet been published." This portion of the report, which occupies some sixty pages, will be found especially valuable to all persons seeking information respecting the general mineral resources of the Pacific Slope.

The elaborate report upon the Comstock Lode—its character, yield, processes of reduction, statistics, etc., is credited to Mr. R. H. Stretch, late State Mineralogist of Nevada. The scientific acquirements of this gentlemen, and his long study of and intimate acquaintance with this remarkable lode, render him a most proper person to report upon it.

Mr. W. M. Gabb, late of the California State Geological Survey, furnished the report on Arizona. Mr. Myron Angel, of the Reese River *Reveille*, Mr. Elwood Evans, of Olympia, Oregon, Messrs. Ainsworth, Hill and Ladd, also of Oregon, are also mentioned as contributing valuable information from their special localities.

This report will do much in the dissemination of useful and correct information with regard to the mineral resources of the Pacific Coast, and in setting forth the advantages which this region possesses for the judicious employment of capital. The suggestions and remarks of the author, with his introductory dissertations, etc., are of much practical value. The gathering and grouping together of such a vast amount of statistics and facts, never before published in a connected form, give evidence of a large amount of personal labor on the part of the Commissioner.

In glancing over the general features of the report, we find first, some 300 pages devoted exclusively to the State of California; then follow 150 pages on the resources of the State of Nevada. Arizona, Utah, Montana and Idaho, occupy the next 100 pages, followed by 60 pages devoted to remarks upon Washington Territory, Oregon and Alaska. We have next two sections of general observations on the Pacific Coast; progress of settlements; immigration and labor, and some considerations on the precious metals. The volume closes with an appendix, in which the reader is made acquainted with the nature of the instructions under which the report has been prepared. An abstract of Congressional legislation in regard to the mineral regions generally, is also given, together with some general remarks on the importance of the establishment of a National School of Mines, and Mr. Stewart's bill for the organization of such an institution. The work closes with a full and carefully prepared index, which will be found of great convenience to the reader in his search for any class of specific information which he may desire to refer to, within the 700 pages of closely printed matter to which this report extends. We shall take occasion, from time to time, to place in the columns of the PRESS such extracts therefrom as may be deemed of special importance to our readers.

QUARTZ MILL BURNED.—We understand that the Old Bear River Quartz mill, on the Fremont Estate, was destroyed by fire on Sunday morning last. Loss about $12,000, some four or five thousand of which was covered by insurance. This is the mill in which the Eureka process has been worked for the past year or so—a combination of the Lundgren barrels and Ryerson superheated steam process. This property belonged to the Fremont Estate; but is now in the hands of the Messrs. Brummagim, who hold it by virtue of a mortgage whose limitation was allowed to pass without redemption, by the Fremont Estate Co., or "Bond Holders," as they are called.

THE OAKLAND SEMINARY FOR YOUNG LADIES, under the management of Mrs. G. M. Blake, will commence another term on Monday, 2d inst. This accomplished lady is aided by competent and experienced teachers in each department of study. Any one wishing information in regard to this school will do well to read a card elsewhere, or address Mrs. B., who will be happy to furnish catalogues, and answer all inquiries.

Tons of Cocoons.

Mr. Hoag, and Capt. Haynie, of Sacramento, as we have already announced, are now busily engaged in feeding silkworms in that city. The first eggs were taken to the cocoonery for hatching, June 1st, and the entire lot of the first feeding have recently completed their cocoons, which are of unusual size and weight—325 only being requisite to make a pound. At this rate, Messrs. Hoag & Haynie have, as the result of their first feeding, 2,461 pounds of cocoons, or nearly one and a quarter tons. It is estimated that this number of worms consumed about twenty tons of leaves. At the conclusion of the feeding there were more leaves on the trees than at the commencement—so thrifty is the growth of the mulberry in that locality. Their cocoonery is on the Yolo side of the Sacramento River, about three miles above the bridge. The second feeding has already commenced, and another ton and a quarter of cocoons may soon be gathered in! They had at the commencement about three millions of eggs; making fair allowance for bad eggs, they will be able to make three feedings of 800,000 each, if their foliage holds out, of which we presume there is no doubt. If the two feedings yet to come in do as well as the first, they will have, as the result of their season's labor, about *three and a half tons of cocoons*.

There are some three or four large silkworm feeders at work in the State this summer. If the others, and the small feeders, do as well as our Sacramento friends, the aggregate of the California cocoon crop will be something of an item in our State's production for the present year, and we shall henceforth have something more than *talk* connected with the silkworm business of California.

The Sacramento *Union*, in alluding to the operations of Messrs. Hoag & Haynie, says that the cocoons which they have produced are of very excellent quality, of unusual size, of a bright straw color, and very hard and compact. That paper is informed that the work of taking care of and feeding them has all been done by Chinamen, one of whom has followed the business for life, and on his own account, in China. The success of the feeding—and which, notwithstanding the unusually cold and unfavorable weather of the season, is unparalleled—is in a measure attributed to the skill and management of this Chinaman. The cocoonery was supplied with stoves, and fire was built in them every night, from the hatching until the cocoons were finished, and the worms fed every four hours, night and day.

INTERIOR STEAM NAVIGATION IN CHINA.—Great efforts are being made to introduce steam navigation on the great rivers of China. The Yantze Kiang has already been opened to foreign capital, and efforts are now being made to induce the Chinese Government to open the Hoang Ho river to foreign commerce. The Yangtse Kiang, in the main items of size, adaptation to navigation and wealth of the district through which it runs, is nearly equal to the Mississippi. They have still another large river fully equal to the second named for inland navigation. China presents advantages for interior navigation not in the least inferior to the United States; and with the dense population which already swarms upon the banks of her rivers, and the favorable encouragement which is now being extended to foreigners, will soon present one of the most inviting fields for the employment of capital to be found in any part of the world.

MINING being a science as well as an art, requires an educated head as well as an educated hand. Either can do but little singly; conjoined they can accomplish almost anything.

The Fair—Progress of Preparation.

The preparations for the approaching Fair continue to progress in a most satisfactory manner. The labors of the Building Commitsee are rapidly drawing to a close in the completion of the Pavilion on Union Sqnare. We had intended to have given a full description of this structure in our present issue; hut the artist who is preparing the engraving with which we propose accompanying euch description, has been unahle to complete it in season for thie week. It will appear in our next, and will give a very good idea of the appearanco which the huilding will presont when completed. The structure, as we have already said, is most admirably adapted for the purposes intended, and will present more architeetnral excellence than any similar huilding which has been creeted on this coast; indeed, we donht whether it has ever heen equaled hy a huilding for any similar purpose in the Atlantic States.

The outside work of the structure will be completed in the course of the coming week. Workmen are are now engaged in putting up the shafting and pulleys from whieh the machinery will be driven. The main line of shafting will be 224 feet in length.

In looking over the list of proposed entriee, we notice that agricultural implements bid fair to form the chief feature in the line of machinery. This fact is important as indicative of the increasing interest which is heginning to be felt in that important and rapidly growing hranch of industry. Many of these implements will not only he of California make, bnt of California invention as well.

Amoug the novelties not heretofore alluded to in onr notices, we may enumerate the following:

A shirt-making machine, in which the whole proccss of shirt-making will be displayed.

A tenoning machine, by G. Duren.

A new hoot-screwing machine—a California invention—by N. Lumsden.

A model in plaster, giving an exact miniature represcntation of ahout six miles equare of the mining district of Gold Hill and Virginia. Thie model has been conetrueted on a scale of one inch to four miles, by R. H. Streteh, Esq., late Geologist of the State of Nevada, and a gentlemen who has studicd the topography, mincralogy and geology of that eelchrated mining district more thoroughly than any other man—so much so that he may be eaid to have it "all in his eye." This exhihit will form a most interesting and instructive novelty.

It is needless to say that the ladies will be there with a large exhibit of every variety of their delicate workmanship. Laces, emhroidery, and fine needlework of every description, will be spread out to please the eye and interest the taste of such as are interested in such things, (and who is not).

The work of assigning positions will soon be commenced, and that of placing the goods for exhihitors will be entered upon by the first of Auguet. The Pavilion will be opened for their reception on Monday, the 27th inst. The goods exhihited will he divided into thirty classcs or departments, which will be given in full in connection with our illustrated description of the building next week.

PREMIUMS.

Besides the ueual distribution of diplomas, the following list of premiums will also he awarded:

Fifty-six Silver Medals will be awarded as special premiums, and apportioned among the eeveral classee or departments, according to the value or importanee of the classes repreeented.

Sixteen Gold Medals will also be awarded to the most valuable display of California products or manufactures, one for each of the following departments or classes, viz: 1, 2, 3, 4, 8, 9, 10, 13, 14, 15, 16, 18, 20, 22, 23 and 27, or sixteen in all.

THE INSTITUTE MEDAL—*par excellence*, and valued at $200, will he awarded to that invention, indnstrial product or manufacture which, in the opinion of the judges, will he of the greatest benefit and valne to the people of California. This medal is to be jeweled, and, uuder the circumstances, will he of great interest to exhibitore, and cannot fail to prove an important incentive on the part of each to excel all others.

The Lowe Refrigerating Process.

We made allusion, some weeks since, to a new proccss recently devised hy Professor Lowe, the aeronaut, for preserving meats, vegetahles, fruits, etc., by retaining them in an atmosphere of great artificial cold. Since that time a company has been formed to introduee the process on a large scale. The principle on which the meats and fruits are preserved is the same as that which we have already described, and which has been introduced to eome exteut at the East, for the preservation of fruits in large houses kept sufficiently cool hy means of ice. Mr. Lowe, however, produces his refrigeration in quite a different manner—by the extraction of heat, or, as it is moro commonly expressed, the production of cold hy evaporation.

It is well known that when carbonic acid gas is subjected to great pressure, it is converted to a eemi-solid condition. When euch condensed gas is allowed to vaporize—as it will freely do when the pressure is removed—a most intense degree of cold is produced. Taking advantage of this fact, the gas is condensed in large quantities, by machinery, and allowed to vaporize in contact with a coil of pipe through which atmospheric air is conveyed to the refrigerator, which contains the meats aud vegetables to he preserved. By this means a temperature as low as may be required is readily kept up in the chamber. Steamers will be fitted np with properly constructed holds, in which meat will be packed iu localities where it can be procured for a small advanee on the cost of slaughtering. That meat, this company claims, can be transported to New York, and served out to the butchers of that city according to their daily wants, at half the price at which it can be afforded when transported by the usual conveyances and slaughtered in the city. Moreover, meat so eupplied has the important advantage of being killed in a healthy condition,—an advantage which cannot be attained where it is killed after long transportation on the hoof. Lines of steamers can he kept up, graduated according to the demand of any market, eo that an abundant and regular supply may alwaye be at hand.

The company starts with a capital of $300,000; with which they hope to be able to make twelve trips a year, ont of which they expect an annual net profit exceeding the entire investment. The eources of supply will be the rich pastures of Texas and Central Sonth America.

As the refrigerator works very much on the prineiple of the ammonia ice machine, the gas employed is confined in a condenser, and can be used over and over again, without lose, while the power could be chcaply and conveniently furnished by the boilers of the boat. An agent of the company is now in England, with the view, it is eupposed, of contracting for the huilding of one of the refrigerating steamers hy the Inman Steamship Company.

TO INVENTORS AND OTHERS.—The public is informed that Mr. J. H. Culver hae opeucd an estahlishment at No. 20 Fremont strcet, over the Phœnix Iron Worke, where inventors and othcre desiring models or patterns for eastings, can have them executed in a satiefactory manner. Those wishing to make experiments, will here have the privilege of power, gratis, to practically test their inventions. This is to enpply a want that has often been felt. Mr. C. has been engaged in this hranch of mechanice for the past ten years, and is already so widely and favorahly known as to need uo further recommendation. All interested in this liue wonld do well to turn to his advertisement which appears to-day.

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books.—*Nevada Gazette.*

CAN it be possible that over five million bottles of PLANTATION BITTERS have been sold during the past year? It is almost incredible, nevertheless it is absolutely true, and it is the most convincing proof of their wonderful medicinal and health-restoring qualities. Every family should be supplied with these Bitters, at whatever cost or trouble it may be to obtain them. Be careful that you get the genuine, and that you are not imposed upon hy a spurious article. *

Agents in Colorado.

CENTRAL CITY.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN.—John A. Lafferty, Postmaster, is our agent in this place.

PERSONAL.—Wanted, by friends in England, information of Andrew Jackson Van Winkle and Peter W. Van Winkle. Address this office. 1v17-3tu

WANTED.—At this office, the postoffice address of Enraght Massey, late of Gold Hill, Nevada.

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Paint will not remove in five minutes. Whether a frightful Burn, a griping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers, or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.

G. H. MOORE, Inventor and Sole Proprietor, 632 Market street, San Francisco, Cal. 21v16-3m

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

☞TO THE PUBLIC.☜

Hear what Bussey has got to say in defence of his Lock:

WHEREAS, Certain parties in San Francisco and elsewhere, are conniving to destroy the reputation of the Bussey Lock, in order to establish other Locks in which they are interested; and

WHEREAS, It is asserted that a certain individual now in this city will put up $5,000 against the same amount, that he can pick the Bussey Lock in eight hours' time; but makes Bussey this generous proposition: That he does not wish to injure him in any way, and if he will pay a certain amount of money the Lock will not be exposed. Wants Money, is in the market at the highest bidder!

Now Bussey wishes it distinctly understood that he pays no man to keep quiet. Bussey's Improved Combination Lock will be on exhibition at the Mechanics' Fair, in competition with other Locks for the First Premium, and a challenge will be given then and there, to the world in general, and H. S. Folger in particular. The security of the Lock will be endorsed in any amount, from $500 to $50,000. The man presuming to pick it will be required to endorse his skill in a corresponding amount.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

13v12 B. M. HARTSHORNE, President.

Mining in Colorado Territory.

A correspondent writes from Black Hawk, Colorado Territory, under recent date, as follows:

This is a very rich and extensive mining district. The ores, for the most part, are much richer than those in California. The veins all lie in granite formations, and are very rich in minerals. Some of the ores cannot well be treated by amalgamation, as they contain much galena and zinc-blende. I have visited nearly all the mills and reduction works in this part of the Territory. The mills here are far inferior to those of California, both as to design and workmanship. The motion of the stamps is very slow, not making over thirteen drops a minute, and the most rapid not to exceed thirty. It makes a Californian ache to witness their lazy gait. Amalgamation is generally effected on copper plates. These plates, placed in front of the batteries, are about four and a half feet wide, and two feet long. Some few pans are employed at some of the mills. These are called the Bartolo. They may be regarded simply as arrastra pans—that is, they have drag-stones instead of mullers on grinding plates; very slow. The mines in this place are gold-bearing, while those in and about Georgetown are silver. Georgetown is about twenty miles southwesterly from this place.

The ores are there treated at one establishment by being roasted in a Bruckner Furnace—such as was on exhibition at the Mechanics' Fair, San Francisco, 1865. It works well. This furnace is well spoken of, and I think it possesses real merit. The ores are then treated in German Barrels. Mr. Martin, the Superintendent of these works, informed me that a short time since he worked 180 tons of ore which yielded $109 per ton. The cost of working was $50 per ton.

Mr. John T. Henrick, Superintendent of the Georgetown smelting works, informed me that he frequently paid as high as $500 a ton for ores.

The ordinary ores, as far as I can ascertain, yield about $20 a ton. Some yield $1,000 and upwards a ton.

As soon as I can find time, I will give you the results of my observations in Colorado.

P. M. R.

OILING THE SEA TO KEEP DOWN THE WAVES.—A whaleship master, Capt. Penniman, of New Bedford, writes to the New York *Herald* that he has followed the sea for twenty-eight years, and been master for ten years, and during that time has saved the vessel under his command twice by "oiling the sea." We have often heard of similar cases, and have conversed with those who have been eye-witnesses to the experiments. The opinion expressed by such parties has always been in accordance with that of Capt. P. The wonder is that, with such cumulative evidence of the value of the suggestions noted below, they have not long ere this been universally put into practice. He says:

When the master of a ship cannot get out of a storm,—that is, when a ship is disabled and be has to take the heft of the gale,—if he has oil on board, start two or three gallons over the side of the ship. This will give the ship smooth water to the windward, and then the oil allowed to run drop by drop is all that is required, for as soon as the sea comes in contact with the oil it breaks, and the ship is in smooth water as long as the oil is allowed to run. In 1864, in the heaviest gale of wind I ever saw, I lost all my sails, then the rudder, and I know the ship could not have ridden the sea for half an hour if I had not had oil on board. Five gallons of oil lasted me fifty-six hours, and this saved the vessel, cargo and lives on board. Let ships of heavy tonnage have two iron tanks of forty gallons each, one on each side, with faucet so arranged that the oil can be started at any time; small vessels ten gallon tanks, and all ships' boats tanks of five gallons each, well filled, so that in case the ships founder or burn, the boats will have oil to smooth the sea in case of a gale. With these tanks of oil on board of ships, and a good man for master—one who knows the laws of storms and handles his ship so as to get it out of the center of the storm—you will have no more foundering of good ships at sea, with the loss of many lives and millions of money.

RAILWAYS in Greece do not appear to pay. A petition for the winding-up of the Athens and Piræus Railway Company (limited) was heard before Vice-Chancellor Giffard, in London, May 25th.

SILVER IN TENNESSEE.—The Athens, Tenn. *Post* is informed that a discovery of rich silver deposits has recently been made near the "Gap of the Mountain," which is creating considerable excitement. It is said that in the early days of the settlement the Indians were known to be in possession of considerable quantities of silver, which they claimed to have obtained from some spot near by, the locality of which they refused to communicate to the white settlers, and the secret of which they carried with them to their graves, or to the western wilds into which they were driven.

18v15-1am-6m

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery,

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

Eley's Ammunition.

These Cartridges are made in three sizes, viz: .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore.

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own Ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES, .459 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolvers of 12 M, 9 M. and 7 M. bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Fell Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

ELEY BROTHERS,

18v16eowly Gray's Inn Road, London, W. C.

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canadas about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address

HORSE HOES.—We learn from the Stockton *Independent* that E. W. Walltan of that city, has assigned a share of tbe patent issued for an improvement in horse hoes to W. H. Derrick, of tbe same city. This hoe will undoubtedly prove of incalculable benefit to farmers in tbe cultivation of grapes, corn, cotton, tobacco, and, indeed, of any crop which requires the frequent stirring of tbe soil, either for the purpose of retaining moistnre, or for killing the grass and weeds. The beam of the hoe is like the beam of the ordinary horse hoe, or the one-horse plow, but there the resemblance ends. The handles, at their former end, are attached to a plate of iron throngb which a bolt extending upward from or through the beam, passes, this bolt constituting a pivot upon wbich the handles turn, laterally, in either direction. Between tbe handles, and nearly over the end of the beam, is a regulating brace, provided with several holes, into any of which tbe iron stay or support, extending upward from the end of the beam, may pass. The object of this brace is that the handles may be set, so that in plowing among grape vines, tobacco, corn or cotton, tbe handles can be arranged at will, in line or ont of line with the beam, and the hands be freed from contact with the row being plowed, wbile the person holding the hoe walks in the center between the rows, and tbe hoe itself works close to one or the otber of tbe rows. The standard of the boe is in two parts, and constitutes both standard and brace. The front and rear edges of these parts are provided, at their base, with notches which catch upon, and are firmly held in, the boe point, by means of a wedge wbich drops between tbe two parts of the standard, and holds tbe point and standard as firmly together as if they were one piece. The hoe point is reversible, and is provided with a mortise throngh its center for the reception of the double standard and wedge. The shares, which are also reversible, extend both ways from the point at an angle not greater than 90° from each other. Each of these sbares is provided witb two sharp cntting edges, for tbe purpose of economy, and also that the natural use and wear of the shares may effect the sharpening of tbeir own edges, for the use of the front edges are found to wear most rapidly upon the under side; and by the novel provisions of the inventor, the shares are readily turned and the used edge presented, or it is changed end for end, and a sharp edge is presented to the soil and weeds, without recourse to a blacksmith. Another prominent feature of this hoe is that a small mold board is attached toward the outer end of one or both its shares, the purpose of which is the throwing of a small quantity of soil to the row wben desired, while, at the same time, the great body of the soil and weeds, wbich has been cut and lifted up by the sbares, is dropped loosely behind tbe hoe. We are informed that the hoe, in its workings, exceeds the most sanguine expectations of the inventor.

Mineral Land Law Blanks
FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

I. Applicants' Declaratory Statement.
II. Diagram, Description of Diagram and Boundaries, and Notice.

Subscribe for the New Volnme of the Mining and Scientific Press.

The proprietors of this journal will undertake o make the Seventeenth Volume of the MINING AND SCIENTIFIC PRESS (commencing July 1st 1868), superior in many respects to former issues.

It will be printed on extra quality of paper, rendering it a handsome volume to file for futuro uso.

An increased amount of editorial labor will be expended in the preparation of leading articles relating to the progress of scientific developments in various parts of the world; new discoveries in geology, mineralogy, metallurgy, and new processes and methods relating to mining in all its branches.

Illustrations will be given of apparatus for saving precious metals, and of machinery and inventions of general interest.

Each number will treat carefully on subjects of home trades, manufactures and domestic economy

Our mining summary and weekly stock report gives the latest news from the most important mines and mining districts throughout the Pacific States and Territories.

An official list of patent claims issued to inventors on the Pacific Coast, is published in advance of all other journals.

The latest prices of stocks are quoted; also the produce and market rates, metal market and prices of copper ores.

Our "Mining Shareholders' Directory" advises holders of meetings, assessments, dividends, sales, etc.

"Answers to Correspondents" afford much of interest to readers and of advantago to the community.

The Mechanical and Scientific Miscellany contained on a single page of each issue wo are frequently told is worth the price of the whole paper.

Information contained in one article has been known to benefit a single subscriber an hundred fold the cost of a year's subscription.

The PRESS was established in 1860, and as a mining and mechanical journal has met with unrivalled success.

Sample copies sent free on application.

Subscription, $5 per annum.

DEWEY & CO.,

Publishers, Patent Agents and Job Printers, corner Sansome and Clay streets, San Francisco.

THERE appears to bo a remarkable accumulation of bullion in France at the present time. Thero were $240,000,000 in the vaults of the Bank of France on the 28th of May last. The unsettled condition of political matters no doubt has much to do with their accumulation.

THE United States possess about one-fourth the entire length of railroads in all the world.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**

1vl San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Mission st., San Francisco.

Hunt's Patent Wind-Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump.

Pumping Machines and general Machinery kept constantly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

23vl6 **E. O. HUNT, Proprietor.**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 15 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21vl6 3m

Brodie's Patented Improvements

[FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

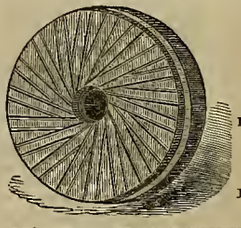
No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... $600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.



A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

REPORTED CURE FOR CANCER.—A Milwaukee paper states that some eight months ago Mr. T. B. Mason, of that city, ascertained that he had a cancer on his face the size of a pin. It was cut out by Dr. Wolcott, and the wound partially healed. Subsequently it grew again, and, while he was at Cincinnati on business, it attained the size of a hickory nut. He remained there since Christmas under treatment, and is now perfectly cured. The process is this: A piece of sticking plaster was put over the cancer, with a circular piece cut out of the center a little larger than the cancer, so that the cancer had a small circular rim of the healthy skin next to it exposed. Then a plaster made of chloride of zinc, blood root and wheat flour was spread on a piece of muslin the size of this circular opening, and applied to the cancer for twenty-four hours. On removing it, the cancer will be found burnt into and appear of the color and hardness of an old shoe sole, and the circular rim outside of it will appear white and parboiled, as if scalded by hot steam. The wound is now dressed, and the outside rim soon separates, and the cancer comes out in a hard lump, and the place heals up. The plaster kills the cancer, so that it sloughs out like dead flesh, and never grows in again. The remedy is said to have been discovered by Dr. Fell, of London, and has been used by him for six or eight years, with unfailing success, and not a case has been known of the reappearance of the cancer when the remedy has been applied.

A VARIETY of beautiful colors, corresponding to those of the rainbow, can be imparted to zinc surfaces, by a simple chemical application continued a length of time proper for the desired color. It is necessary that the metal be pure, and especially free from lead. It is therefore to be rubbed with silicious sand moistened with hydrochloric acid, then dipped in water and rubbed vigorously with blotting-paper. The zinc is then immersed in three parts by weight of dry tartrate of copper in four parts caustic soda, with forty-eight parts distilled water, the whole at a temperature of about 50 deg. Fah. The colors will appear successively, in the prismatic order, according to the period of immersion. In two minutes the violet will appear; in three, dark blue; in four and a half, a golden yellow; in eight and a half, a red purple. Intermediate terms give intermediate tints. When colored, the zinc is well washed with water, and for greater permanence of color may be varnished.

TRANSPARENT SOAP.—A patent has just been issued to Morgan W. Brown, of New York City, for the following method of making transparent soap:

Dissolve or melt any settled curd or grained soaps in any suitable vessel to which heat can conveniently be applied. As soon as the soap is melted and hot, pour into it from twenty-five to thirty pounds of sal-soda, previously melted without water, to every hundred pounds of soap, while hot. Agitate the soap and sal-soda and very thoroughly incorporate the paste at a low degree of heat, as it mixes much better than at a high degree. Now pour slowly from 100 to 125 pounds of concentrated glycerin to every 100 pounds of the soap. Keep up a very moderate heat, and agitate the whole until it is a liquid, and thin as a syrup, and as soon as it forms a thin transparent fluid, let it settle well under cover, and draw off the settled fluid into the cooling molds or soap frames, when, as soon as it is cold and hard, it is cut into bars or cakes, in the usual manner, or cast in molds, presses, etc.

A VERY PRETTY EXPERIMENT.—Take a sheet or piece of ordinary writing paper, say commercial note, and saturate it in a solution of bi-chromate of potassium, 1 oz., with water, 3 oz., and dry it in the sun. Cut the paper into squares of about three inches, and double them back and forth until the form—a zigzag section—will stand on a table, and ignite the top of the slip. The result will be a slow combustion, the products of the combustion growing out of the edge of the paper like spears of grass and curling over to represent very faithfully the curving and depending leaves of the palm and cane. If the process is carried on without drafts of air the final result will be a bunch of beautiful blue-green filaments, while the process of combustion itself will prove a means of pleasant recreation.

BRAZIL has been driven to some extremity by the Paraguayan war. At the headquarters of the army, at Tayi, $220 has been willingly paid for a ton of coal, and cannon balls are considered cheap at $10 each.

SOMBRERO PHOSPHATE COMPANY.—The island of Sombrero, which forms one of the groups of West India Islands, and is situated not very far from the Virgin Islands and the Island of St. Thomas, consists almost entirely of a deposit of phosphate of lime, which is very valuable, and much used for agricultural purposes, many thousands of tons being annually shipped to Europe and America. The island is leased from the British Government by a limited liability company, called the Sombrero Phosphate Company, which has its seat of direction in London.

There are at present about 300 colored laborers employed by the company to raise this phosphate, under a well organized staff of English officers. The mining operations are being carried on at present with much vigor, and are directed chiefly to subaqueous blasting, by means of which a very rich quality of phosphate is raised. The quantity of this article may be said to be practically inexhaustible, and the demand is very much on the increase, both in Europe and America, necessitating a continued increase in the extent of the company's operation.

TRANSFORMATION OF MOTION INTO HEAT. Numerous instances of this transformation occur daily; that it certainly takes place, even in the case of fluids, has been demonstrated in the most satisfactory manner by M. Rennie. He boiled an egg by merely placing it in a vessel which contained about ten pounds of water, and which was made to revolve 232 times in a minute. It is clear, that in this case, motion was the only possible source of heat, and the result was the more striking, as the friction of fluids is so very much less than that of solids.

Another striking instance of the conversion of motion into heat, recently occurred in Lowell, Mass., where a turbine water wheel, resting on a block of case-hardened iron, the pin of the shaft being of steel, and two and a half inches thick, the turbine suddenly began to run unsteady, and an examination showed that both pin and block were partially fused. And this had occurred, though placed in a current of 4,500 cubic feet of water.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

THE GOLDEN ERA.
Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.
THE GOLDEN ERA
Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concen mining patronage.

INTERESTING TO BOOT AND SHOEMAKERS. Mr. Evan T. Rogers, who has recently devised a new system for marking counters and straps, and all ornamental marking on leather work, for machine or hand sewing, by which he dispenses with all patterns, rules and lines, is now introducing his device among the trades in this State. By the use of his device the impressions are made by one or two blows with a hammer on the markers, which are made of metal or other hard substance; the hacks at the same time being protected from injury by a pad of india rubber or soft leather. This device also makes a channel for the stitches to drop into, so that the friction from wear cannot destroy the material of the thread. This renders the device valuable for allowing of the use of light tension on the machine. One man can perform more work, and do it more correctly by the aid of this invention, than three can accomplish by the old method; moreover it does away with all difficulty between the marker and operator. The device will commend itself to the confidence of all manufacturers after they have employed it in the manufacture of one case of boots. The invention was patented in February, 1868, and State rights for its use will be sold on application to the inventor, E. T. Rogers, San José, Cal.

AMERICAN

(WALTHAM)

WATCHES,

THE BEST!

THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a

MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale, under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss Imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first-class dealers in the United States and British Provinces.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

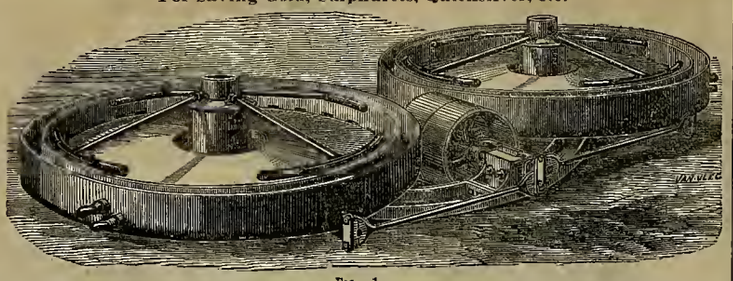

FIG. 1.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

Fig. 1 is a perspective view of that pan as now constructed. For economy of space and machinery, one shaft is made to drive two pans, which are set and arranged as shown in the engraving.

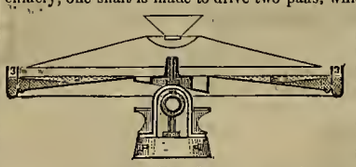

FIG. 2.

Fig 2 is a section through the center of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

RECOMMENDATIONS:

NEWCASTLE, Cal., June 21, 1868.

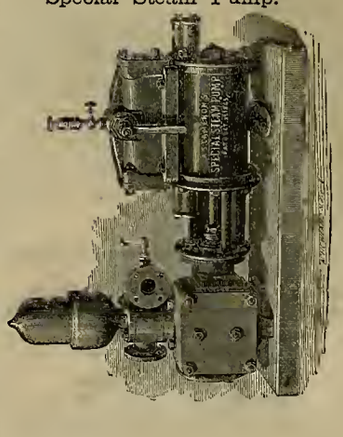
M. HUNGERFORD, ESQ.—*Dear Sir*:—Having used eight of your improved Concentrators (built by Goss & Lambard, of Sacramento), it affords me pleasure to bear testimony to their efficiency and adaptation to the purposes for which they are designed. I have used various styles of Concentrators during the last five years, but have found nothing that begins to compare with your machine, for durability and thorough concentration; and I can confidently recommend them to millmen, being, in my opinion, the best Concentrator now in use. Yours truly, J. C. COREY.

NEWCASTLE, Placer County, Cal., June 23, 1868.

Mr. MORGAN HUNGERFORD, ESQ.—*Dear Sir*:—After witnessing the operation of eight of your Concentrators for a month, in the Golden Rule mill, Placer County, and running the same number in the Mt. Pleasant mill, El Dorado County, I am satisfied they are superior, as Concentrators, and more durable and less liable to get out of order, than any Concentraters I have seen; and I recommend them to millmen, feeling assured they will, after the most thorough trial, be pleased with them.

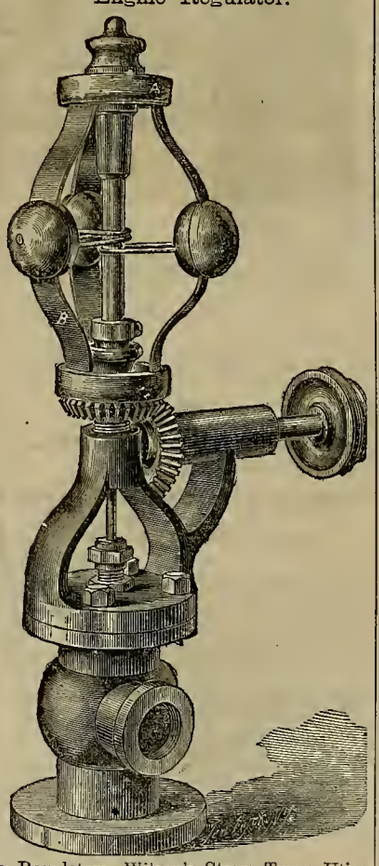
Very respectfully, L. E. ATCHISON, Metallurgist.

BIG OAK FLAT, May 23, 1868.—*Mr. Thos. Mulford*—Dear Sir:—I have used two of Mr. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.



These Pans can be seen at the Pioneer Mills, entrance on Stephenson street, San Francisco.

In future these Pans will be manufactured exclusively by GOSS & LAMBARD, of Sacramento, which is a guarantee that they will be built in the most substantial manner. Price, $300.



Address, Goss & Lambard, Sacramento, or M. HUNGERFORD, San Francisco.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

MINING AND SCIENTIFIC PRESS.

Subscription, $3 Per Annum. Single Copies, 15 Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 25, 1868.

VOLUME XVII. Number 4.

Table of Contents.

Mechanics' Institute Pavilion.—Illustrated.
Mining Prospects in Northern California.
Agricultural and Mineral Lands.
The Mariposa Estate.
Our Ocean Steam Marine.
Mining Probts.
Mineral Resources of the Pacific Slope.
General Condition of the Mining Interest.
A Mountain Railroad in Colorado.
The Hoosac Tunnel.
Silk—Now is the Time.
Mechanics' Institute Fair—Classification of Goods.
An Improved Anchor.
Powder in Placer Mining.
Bridge at St. Louis of 500 feet Span.
Rules to Discover the Lost Part of a Shifted Vein.
The Siemens' Furnace.
Generating Steam by Gas.
San Francisco Market Rates.
Stock Prices—Bid and Asked.

MECHANICAL MISCELLANY.—Bearings for Shafts; How to Lay Shingles; Scythes; To Prevent Boiler Explosions; Artificial Marble; Durability of Buried Iron Pipes.

SCIENTIFIC MISCELLANY.—Carbon in Iron; Refraction; Extinct Animals of this Continent; A Fragrant Substance from Resin; Oil Upon Water.

MINING SUMMARY—Comprising late intelligence from the various counties and districts in California, Arizona, British Columbia, Colorado, Idaho, Montana, New Mexico, Nevada, Oregon, Wyoming and Utah.

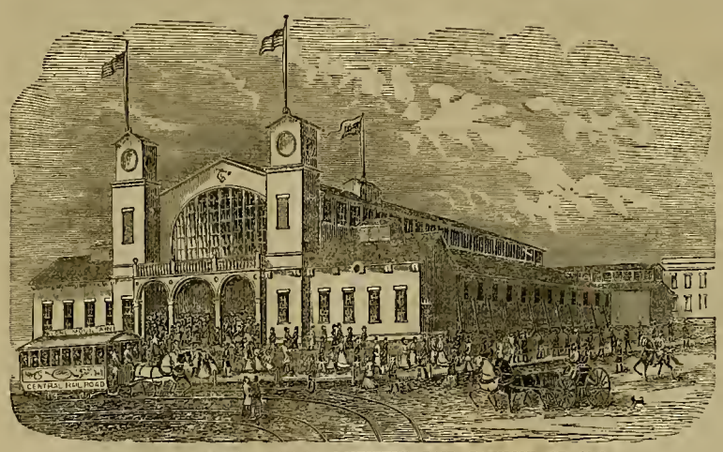
New Patents and Inventions.
San Francisco Mining Stockholders' Directory.
San Francisco Weekly Stock Circular.
New Incorporations—List of Officers.
Notices to Correspondents.

The Mechanics' Institute Pavilion.

We give herewith a spirited illustration of the new Mechanics' Institute Pavilion, now nearly completed on Union Square, as we expect it will appear on the day of its opening, when large crowds will be rushing thither for admission.

THE EXTERIOR OF THE PAVILION.

In viewing the Pavilion, as shown in the engraving, the observer is supposed to be standing at the corner of Stockton and Post streets. The structure is a parallelogram in form, with its greatest length running east and west. Its entire length is 337 feet by a width of 205, exclusive of boiler room. The number of square feet of ground floor is 72,000, against 55,000, occupied by the pavilion of 1865-6. It is built entirely of wood, and the chief points aimed at in its construction have been lightness, strength and economy of cost and space. In securing these advantages, the architect, Mr. William Patton, has succeeded most admirably—such is the universal verdict.



The main hall of the building is 272 feet long and 180 feet wide, with a central, arched nave of the same length, 80 feet wide and 68 feet high, occupying the space beneath the elevated roof shown in the engraving. Around the entire nave runs a gallery nine feet wide, with twenty feet width at the end connections, which will be used mainly for promenade purposes. It will be reached by four wide stair-cases, two upon either side, and a steam hoistway will be elegantly fitted up, near the entrance, after the style of the most approved hoist-ways in use at the hotels in the Atlantic States and Europe. This, of itself, will form quite a feature in the exhibition—being the first of the kind erected on this coast.

The Pavilion will be lighted by continuous windows along both sides, while the front will consist of one semi-circular window, of forty feet radius, arranged as shown by our artist. The whole will be brilliantly illuminated in the evening by upwards of 1,200 gas burners.

The main entrance is from Stockton street, and is flanked by two towers 80 feet high, surmounted by flagstaffs. The grand vestibule is 50 feet wide, and leads direct to the body of the building.

The wing shown upon the right of the entrance is reserved for the exhibition of musical instruments, for which purpose its acoustic properties are very well adapted. This room will be 35 by 60 feet in area, and will be used as occasion may require for concerts. Adjoining this department on the left, and in the base of the right hand tower are the Committee Rooms. In each of the towers, which are sixteen feet square, there will be four rooms.

It was originally intended that the room on the left of the entrance, corresponding to the Music Room, should be occupied as a restaurant, with a ladies' dining room and dressing room adjacent; but the calls from exhibitors for space is so much greater than was anticipated, that it is now proposed

VIEW OF THE MECHANICS' INSTITUTE FAIR PAVILION OF 1868.

to occupy this room also for exhibition purposes, and to erect an additional room on the south side of the main building for a restaurant, etc.

THE ART GALLERY

is placed across the rear of the main building, and is 205 feet long by 30 in width. It will receive an abundance of light from above, by a continuous line of perpendicular sash, placed upon the roof, as shown in the engraving, where the extreme northern end of the gallery is seen. Easy and abundant access and egress to and from the Art Gallery will be obtained by five passageways—one from the nave, and two from each of the wings or aisles of the main hall. The walls of the gallery will be tinted so as to subdue the sharpness of the light, and relieve the paintings, photographs, etc., which will be placed upon the walls. This will form a most interesting feature of the exhibition, far exceeding anything of the kind hitherto witnessed on this coast. The various artists of the city have largely engaged space—so much so, that a portion, if not all the photographs will have to be placed across one of the ends of the gallery in the main building, which will be made of extra width, and equally well arranged and lighted for such purpose as the Art Gallery will be.

On the north side of the main building, and near to the projecting wing, to be used as an exhibition room for musical instruments, two large rooms will be put up to contain the boilers and engines which are to supply steam for the motive power to be used during the exhibition.

THE INTERIOR.

It is designed to make the effect of the entrance something altogether superior to what has heretofore been attempted. As the visitor advances from the grand vestibule, he will behold an immense arched nave 272 feet in length, 80 in width and 68 feet high, flanked on either side by aisles of corresponding depth—30 feet in hight and 40 feet wide, and from which it will be separated by a double row of columns or ribs, upon which rest eighteen magnificent arches, each of eighty feet span, and supported upon piers, which spring up through the floor from the solid earth below. These columns or ribs have been formed by bolting and clamping together eight planks, each two by six inches. So firmly has this work been done, that after the clamps which were used to hold the planks together were removed, the latter did not spring apart even one-eighth of an inch. Around the base of the arch are placed the spacious promenade galleries, already described. The view from either end of these galleries, sweeping as it will through the entire main building, will be a most magnificent one. The area of the galleries will be about 3,000 superficial feet.

In the center of the nave an elegant fountain will be erected, with an open space around it; while along the middle, east and west from the center, the horticultural display will be arranged.

The working machinery will be placed upon the right of the entrance and within the northern aisle. The boilers and engine to drive the same, will be placed outside of the main northern wall, in the open space seen in the engraving between the Music Hall and the Art Gallery. In the south aisle and around the sides of the nave, the miscellaneous exhibitions will be duly arranged, in classes, and separated by convenient avenues running mainly from end to end of the building.

CONSTRUCTION AND COST.

The whole of the work of construction has been done by day's work, under the superintendence of the architect and the Committee. The building will cost, in all, about $30,000. The quantity of lumber used in its construction is about 600,000 feet, and 700,000 shingles have also been expended in roofing. The whole of the exterior work is now nearly finished. The interior will be completed by the first of August, when the Pavilion will be ready for the reception of goods.

The goods and manufactures to be exhibited will be divided into thirty classes, which are given in full on another page.

OUR OCEAN STEAM MARINE.—The ocean steamship marine belonging to this port, is rapidly increasing in importance. Six round trips are now made between this port and Panama every month. In addition to the New York connections at the Isthmus, these steamers also connect on the east side with both English and French lines direct to Europe; and with Australian, Central and South American lines on the west side of the Isthmus. We have also a monthly line of steamers to China and Japan; steamers making the round trip every twenty days to the Sandwich Islands; the round trip as often, by another line, to Mexican ports; a semi-monthly line to British Columbia; a tri-monthly to Oregon; one coast line to ports in this State, to the north, and another to ports to the south of this city. The fleet required to accomplish this work number about forty steamers—nearly all first class and aggregating 60,000 of tonnage.

Our river fleet to various portions of the extensive Bay of San Francisco, upon the upper and lower Sacramento river, and on the San Joaquin, is also equal to the equipment for any similar trade in the interior waters of any country in the world. The sea-going sailing craft on its way to this port, on the 1st inst., was 128 vessels, aggregating fully 100,000 tons, or nearly 800 tons each; and yet the fear is that we shall be short of tonnage to take away our productions for the current year. It will require upwards of 300,000 of sail tonnage to market our home products during the present season, exclusive of what will go by steamer. The total amount of tonnage which will enter and depart from this port during the coming year, will probably exceed 650,000 tons—over one-half of which will be by steam.

GEN. W. S. ROSECRANS (one of our most appreciative subscribers to the MINING AND SCIENTIFIC PRESS) has recently been appointed and confirmed U. S. Minister to Spain. Gen. Rosecrans is a bona fide mine-owner, and has recently spent considerable time on this coast in mine engineering and examinations. Many friends here are pleased to learn of his appointment, but will regret his necessary absence.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[From our Traveling Correspondent.]

Mining Prospects in Northern California.

[Continued from page 34.]

A VALUABLE MINE.

First and foremost of all the mines in this neighborhood, is the Black Bear mine, owned by Messrs. Coukling, Daggett & Rend. This ledge was discovered in August, 1860, by Callahan & Hart, and paid in arastra from $40 to $100 per ton, to the depth of fifteen feet from surfaee. The company began crushing with stamps in October, 1862; the mine changed hands in 1865, and beeame the property of William Coddington, of San Franeisco. He failing to make the mine pay, sold to the present owners in the spring of 1866. This mine apparently comprises two ledges—one running north and south, and the other east and west; the latter cutting through the former something in the shape of the letter X. They vary in width from three to fifteen feet. The pay shute extends an average of 150 feet in either direction from the crossing or intersection, which gives 300 feet on each ledge, or a total of 600 feet of pay chimney. But very little assorting is done, as they usually crush the bulk of the ore taken out, realizing a yield all the way from $12 to $50 per ton. The gold is .835 fine, or worth $17⅞ per ounce. The mine is worked by tunnels, four of which are already started, including the two upper levels which are now worked out. They are now into the hill, on the third level, about 700 feet, and have two year's crushing now in sight. The mill is situated about two miles below the mine, and connected with the same by a fine road of easy grade, requiring only one span of horses to a wagon, which will carry four tons to a load. The mill is driven by water, has twelve stamps, and crushes an average of eighteen tons per day. The process of working is that of the battery, blanket and riffles. They have discarded copper plates, and are saving the bulk of the gold in the riffles, which Mr. Daggett has so ingeniously constructed as to produce a result heretofore unattained in their use throughout the State. That this mine is paying steadily and handsomely, there is no manner of doubt. Messrs. Daggett & Conkling hold the reins of management, and are, by the way, plain, practical miners, possessing a requisite amount of knowledge to constitute them masters of their business.

AT ORLEANS BAR AND VICINITY

there are some very extensive hydraulic claims, many of which are paying largely. At Gold Bluff, there are two heaoh claims—perpetual mines—constantly replenished whenever there is rough weather or heavy surf. The whole ground covers a line of heach about five miles in length. The upper claim is owned by Gen. James Wilson, of San Francisco, and the lower by Messrs. Sandige & Co. Their process of working is the same as at Crescent City; but the land is much richer, varying usually from one cent to ten cents to the shovel; except in a few instances, it has been gathered at the rate of five cents per shovel. These mines are evidently inexhaustible, and will be worth full as much 100 years from now, as to-day.

At Trinidad, Dr. Veatch has secured a range of black sand (old heach) where it is presumed he will accomplish something as soon as he gets fairly under way.

TRINITY COUNTY.

This is emphatically a county rich in placers; nearly every foot of ground passed over by the writer, was almost an unbroken chain of deep beds of washed gravel. Thousands of acres of the same may be seen without a sign of a prospect hole ever having been sunk to test the existence of gold; but generally where a prospect *has* been made, the efforts have been crowned with the happiest results. At Trinity Center, a few companies with limited capital have made a sufficient beginning to prove their ground valuable, and that is all. Their mode of working is on the "one-horse" hydraulic plan, as before mentioned.

At Minersville, there is one claim doing a very fine business. This is owned and worked by G. F. Diener. It is worked in part by hydraulics, but principally by what is termed "gouging"—viz: applying heavy reservoir heads every few hours, letting on five or six thousand inches, carrying away trees, huge boulders, and in fact, everything that may obstruct, exeepting the gold, which, being coarse, lodges in the bed rock flumes. Diener has evidently got a good thing, but he does not mean to nurse it.

At Weaverville, times are comparatively lively; some few claims are doing very well, but the great enterprise in contemplation here is that of the Weaver Creek Milling and Mining Co's project, of putting in an immense flume at a point on the creek, which will tap the whole basin of Weaver diggings. This is an incorporated company, divided into 500 shares, and $25,000 capital, with the privilege of increasing as the enterprise may demand. Messrs. Davidson, Allen & Jenkins, are the officers of the company, as well as exclusive managers of the enterprise. They are all thorough, practical business men, and know what they are about. They have their own money invested, and intend to move slow, but sure. They will build only 1,000 feet of the flume this year; subsequently adding as the working of their ground may demand. The flume is to be sixteen feet wide by ten feet high, with a partition two feet high, placed six feet from one side. This will give three sizes to the flume, to accommodate it to the varying stage of water. This is certainly a very laudable enterprise, and will not only enrich the stockholders, but will help the camp beyond all calculation.

At Junction City and vicinity, mining is quite brisk, according to all accounts. The writer was unable to visit this portion of the county.

Lewiston is doing a little hydraulic mining, enough to support a very good hotel and two stores. Some few claims are paying very well.

SHASTA COUNTY.

This is evidently a quartz county, and well worth the serious attention of quartz men. But little prospecting has been done as yet. All the indications that can be reasonably asked for, above ground, are sufficient to warrant the running of tunnels and sinking of shafts to test the value of numberless leads that can be found nearly all over the county. Gold, silver, cinnabar and copper are found, and in many instances showing ores of the finest character. Only one lead, however, is now being worked successfully, viz: the Washington, at French Gulch. This is an incorporated company of 6,000 shares, E. Lewin, President, John Souter, Treasurer, and John Syme, Mining Superintendent. This is one of the oldest mines in the State, yet it has accomplished nothing to establish any degree of permanency or value until within the last two years, when the management fell into practical hands, and has been made to pay largely up to the present time. Operations were first commenced in 1851, and stopped in 1856; then laid still four years, and started again in 1860, running only ten stamps up to the present summer, when twelve more have been added, making twenty-two stamps in all now in operation. The mine looks well, producing as fine looking ore as Grass Valley can boast of. The lead is large—from three to six feet—is easily worked by tunnel, and sufficiently tested to establish its permanency—being down nearly 300 feet. The mill is driven by water; twelve stamps by "hurdy-gurdy," and ten by "overshot" wheel. The process of saving the gold is that of battery and copper plate. The ore is rich, varying from $20 to $50 per ton. Their last clean up—when visited by the writer—yielded a little over 500 ounces from thirteen days' run.

Near the town of French Gulch, the Churchhill Company, and Hunter & Mosher, are doing very well running their hydraulic claims. They have water only seven months of the year.

At Piety Hill, the Shasta Hydraulic Co., G. F. McPherson, Superintendent, are extensively engaged opening up a large tract of very rich ground. From a run of twenty-eight days, a clean up of 247 ounces was made. This promises well as a starter. They contemplate getting in a ditch as soon as practicable, which will give more pressure as well as more water. Mr. McPherson is certainly well schooled in hydraulic mining, and is applying all the later improvements.

About three miles from this place is quite an extensive district of fine looking silver-bearing quartz, owned principally in the immediate neighborhood, and Shasta City. The ledges are large, varying from four to six feet in width, and assaying from $400 to $600 per ton. This district is really worthy the attention of silver mine operators.

B.

Agricultural and Mineral Lands.

INSTRUCTIONS AS TO MAKING PROOF—THE LATEST LAND OFFICE DECISION.

Department of the Interior, General Land Office, May 16, 1868.

To Registers and Receivers of the United States Land Offices:

Gentlemen—The 10th section of the Mining Act of July 26, 1866, provides for homesteads, made prior to the passage of the act by citizens of the United States, or persons who had declared their intention to become citizens, upon land previously reserved as mineral, and as such excluded from survey and sale, but which are properly agricultural, no valuable mines of gold, silver, cinnibar, or copper, having been discovered thereon, and which have been improved and used by settlers for agricultural purposes. These settlers have a right to preëmption to such land, not exceeding 160 acres, and may buy the same at the minimum of $1.25 per acre, or enter them under the homestead law, after they become surveyed, upon the usual and proper proceedings in such cases. If the deputy surveyor returns it as agricultural, and there is no data to the contrary, and no one files an affidavit of its being more valuable for mineral than for agricultural uses, the settler will be allowed to enter it under the provisions of said 10th section. If an affidavit is filed alleging the land to be mineral, a trial must be had to determine whether it is more valuable for mining purposes than for agricultural. In such cases a day will be fixed for the hearing, giving to the claimant and to the party filing the affidavit sufficient notice to enable them to be present with their witnesses; and when the tract had been occupied for agricultural purposes, and improved as such, before the 26th of July, 1866, the burden of proof will be upon the party seeking to establish its mineral character, and the testimony should be of a nature clearly proving the truth of such allegations, before a decision is rendered against the right of the settler to enter the land.

Should the deputy surveyor return the land as mineral, the settler will be required to furnish satisfactory proof of the error of such return prior to entering the premises claimed under said 10th section.

The return of a deputy surveyor, although entitled to respect as coming from a sworn officer, is not to be taken as conclusive in these cases, when disputed, but the matter must be investigated by the examination of witnesses, capable from experience and observation, and from previous examination, to testify understandingly in reference to the existence of minerals upon any particular tract, and whether the deposit is of sufficient extent to render it more valuable for mining than for agriculture.

When lands of the character contemplated by said 10th section have not yet been filed upon, you should satisfy yourselves as to which class they belong before taking steps looking to their disposal.

The 11th section of the Mining Act authorizes the Secretary of the Interior, after the survey of lands previously reserved as mineral, to designate and set apart such portions of them as are clearly agricultural, which are made subjects to preëmption and disposal as other public lands of the United States.

To give effect to this section, the Surveyors General in the mining States and Territories have been instructed to require their deputies to describe in their field notes, and designate on township plats, such lands as are agricultural. After the filing of the plats in the district land offices, if no counter affidavits are presented, the tracts designated "agricultural lands" may be filed upon under the preëmption, or taken under the homestead laws; but preëmptors will not be permitted to prove up and enter until after such a period of actual settlement and cultivation as shall show good faith—say not less than six months from the date of settlement embraced in the filing of the declaratory statement; and if before the expiration of such time an affidavit is filed alleging the mineral character of the particular tract claimed, a trial must be had before an entry is made, to determine that question.

It is not doubted that in every township there are tracts of land more valuable for farms and gardens than for mining purposes, and the object of the law is to segregate these from the mineral and dispose of them as agricultural.

Errors of judgment may sometimes occur, but as a general rule it is believed a careful examination will enable claimants to act with safety in reference to these lands, and although they may be put to the necessity of proving their chief value to be for purposes of agriculture by an opposing affidavit filed any time before entry, yet where reasonable precaution has been exercised, such proof seldom fails, at least as to the whole tract filed upon, and if a profitable mine were discovered upon a part of the premises, it would only enhance the value of the remaining portion.

Affidavits alleging particular lands to be more valuable as mineral than as arable, must apply to each of the smallest legal subdivisions. Of a quarter section, 120 acres may be mineral, and the remaining 40 arable, and the mineral character of the former is no reason why the latter should not be entered as agricultural. Nor is it sufficient that such affidavits are based upon opinion or belief. They must contain a statement of facts within the knowledge of deponents, derived from actual observation or examination, furnishing a strong presumption that the particular subdivision is mineral land, and more valuable as such than as agricultural. Mere speculation, based upon no positive knowledge, and disclosing no material facts, will not be received, and claimants ought not to be put to the trouble and expense of meeting affidavits of this character. There should be the utmost good faith required from both sides. Lands more valuable for mineral than for other purposes are not to be taken under the preëmption or homestead laws; nor, on the other hand, are parties to be intimidated from making settlements upon, and ultimately entering under these laws, such lands as are most useful for agricultural purposes, simply because valuable lands may lie in the immediate vicinity. Both classes of land are to be disposed of under their appropriate laws, and neither interest is to be subordinated to the other to the detriment of the public welfare.

If the land officers in the various districts have reason to believe that mineral affidavits are being placed on timber lands on which no mineral has been found, for the purpose of keeping the same from settlement until after the timber has been removed, they will inform the parties filing such papers that affidavits in which it is not alleged that either gold, silver, cinnibar, or copper, have been found, are insufficient; and however specific and full such affidavits may be, they are not to be deemed conclusive as to the matters alleged. Any settler filing an affidavit of a contrary character and desiring to enter the particular tract as agricultural land, is entitled to have the question examined, and on proving it to be more valuable as arable than as mineral, may file upon it under the preëmption or enter it under the homestead law, and in due time consummate the title.

It matters not whether the precious metals are found in quartz ledges, or in placer or hydraulic mines, if the particular subdivisions of the public lands containing them are more valuable for mining than for agriculture, they cannot be entered under the preëmption or homestead law. If placers once valuable have become exhausted so as no longer to be valuable as mines, the land may then be entered as arable.

These affidavits are to be filed with the Register and copies transmited to this office. They are to be registered and carefully filed, but need not be recorded.

In reference to the fees authorized in preëmption and homestead cases, and in proving up the same, you are referred to the legal provisions and instructions given in the circular from this office, dated September 17, 1867.

When necessary, all witnesses must be carefully cross-examined in order to elicit the truth, and the testimony, with the papers in each case, together with the joint opinion of the district land officers, will be transmitted to this office for examination and review. Respectfully, Jos. S. Wilson, Com'r.

The Railroad Fleet.—There are now fourteen ships on their way to this port laden with railroad iron, with some four or five others ready to follow; to say nothing of the fact that nearly all the regular lines bring more or less of this article. And yet, so rapidly is the iron being put down on the various roads in progress throughout this coast, that the Pacific Railroad Company is now transporting rails across the Isthmus at an enormous extra expense.

Mining in Mexico.—It is worthy of notice that many of the prominent and wealthy men of Mexico have recently turned their attention to mining, and with a degree of success that is considered especially encouraging.

Mechanical.

Bearings for Shafts.

The usual pressure allowed on metallic bearings for shafts, varies from 50 to 200 pounds per square inch. The best results, so far as friction is concerned, is found to be about 90 pounds per inch on bearings, well oiled. A few years since, a discussion in the English Board of Engineers developed some interesting facts with regard to the value of wood for bearings. It was stated in that discussion that an experiment had been made wherein the extraordinary pressure of 8,000 pounds per square inch was placed upon a wood bearing, with a speed on the rubbing surfaces of 260 feet per minute. This motion was kept up continuously for three hours, without producing the least sensible abrasion. In these experiments no oil was used; but the bearings were kept well covered with water.

It appears that wood bearings do much better with water for a lubricating medium than with oil. Trials of wood with oil lubrication, prove that it is about equal in value, for that purpose, with brass. Although the absolute quantity of heat generated is greater with brass than with wood, in the proportion of 31 to 20; still the non-conductive nature of the latter renders even the lower amount of heat generated by its use with oil, more detrimental than the larger amount in the use of brass, by reason of the liability of the wood to char. Wood bearings, where any considerable speed is combined with much pressure, are inexpedient, except when kept well covered with water. Water is better than oil, from the fact that it is a better conductor of heat. A small stream of water trickling upon a journal will convey away therefrom a large amount of heat.

A force of a hundred pounds applied to a weight, on easily moving wheels, on a hard road, will move about twenty-five times itself—that is, 2,500 pounds. If on a plank or a good McAdam road, it would move about sixty times as much, or three tons, and on the best railway track, two hundred and eighty times, or about fourteen tons. A force of three hundred pounds applied to a sled with cast-iron shoes will move half a ton on a sanded plank road; but that is too much for a horse. A two-horse mower will require a draught varying from three hundred and fifty to four hundred and fifty pounds.

The lightest draught required to plow a sod of stiff clay, which has remained long unplowed, to a depth of seven inches, will be about three hundred and eighty pounds, and the heaviest about five hundred and sixty, the average about four hundred and seventy pounds.

For the Prevention of Boiler Explosions.—The Pennsylvania Railroad Company have recently been experimenting at Alateona, Pa., with steam boilers, for the purpose of ascertaining the causes of their explosion. In view of the great importance and expense of making such a series of experiments full and practical, it has been suggested that the General Government should offer reasonable inducements for the solution of this question, and the discovery of preventive measures.

Iron.—A famous British minister, Mr. Horner, once said that iron was the machinery of civilized society, and Locke declared that if the use of iron were lost among mankind, they would unavoidably return to the savage state. At the same time he styled the person who first made use of iron, "father of arts and author of plenty;" for of iron all tools are made, and with the tools thus made man tills the earth, builds houses, makes clothes, constructs steam engines, builds railroads, constructs steamboats—in fine, does all the business of civilized life.

How to Lay Sawed Shingles.

Much more depends on the manner in which sawed shingles are laid, than on the laying of shaved shingles. A sawed shingle will last twice as long when properly laid than when improperly placed upon the roof. Quite too little attention is paid to this matter. Many people—many, even, who call themselves carpenters—are not aware of the importance of this matter. To lay any description of shingles well and rapidly requires considerable practice. To lay sawed shingles and make the best work that can be made with them, requires still more experience, or at least a more careful eye.

Nearly all sawed shingles have a rough side, and a smooth one, *i. e.*, they are sawn from the butt somewhat across the grain of the wood; the grains lapping one over the other on the sides of the shingles should be laid so that the water will run over and not into them as it flows from the roof; in other words lay them "right side up with care." If perfectly dry, they should be laid about one-eighth of an inch apart, to give them room to swell in wet weather; they should have but one nail in each shingle. Here is where most persons fail. In nailing, it is often said that we cannot nail shingles *too well*. That's so, but there is danger of nailing sawed shingles *too much*. Where they are nailed down too close they retain moisture, and consequently rot sooner than they would if one nail only were used in each shingle, which gives them a chance to curl up a little, and admit the air to circulate on the under side.

The most practical and experienced builders prefer the above method of laying loosely, all kinds of sawed shingles. To make the most durable roof with such materials, it should first be covered with narrow boards, put about three inches apart, across the rafters, and then lay the shingles on them as described. It will also be found of great advantage to immerse them, previous to being laid, in lime water; or the shingles should be covered with some other antiseptic wash or paint.

Scythes.—A complaint is often made by workmen of their scythes not acting well, or of the edge not cutting uniformly, and the form being wrong, etc.; now the form best suited to each mower, says one who has tried it, may be tested by a very simple experiment. Let a man with a piece of chalk in his hand, walk up to a high wall, or barn door, and raising it as high as he can, strike a curve from right to left; the line so traced is the exact form that his scythe should be; and if he applies the edge of it, and find it to correspond, it will cut uniformly from point to heel, and save himself much trouble and labor.

Durability of Buried Iron Pipes.—A cast iron water pipe laid by the Old Manhattan Water Company, at the corner of John and William streets, New York, supposed to be more than forty years ago, was recently taken up and showed no corrosion whatever. It was gray iron, which confirms Mr. McAlpine's opinion as to the value of this variety for pipes. Mr. James B. Francis lately took up some cast iron water-pipes at Lowell, Mass., which were laid in 1828. With regard to the condition of the metal, he says: "39 years' use appears to have made but little impression upon it."

Artificial Marble.—Machinery has been put in operation in St. Louis, by which white artificial marble is being manufactured, which is said to be equal in durability and texture to what would be called an excellent article of quarried marble. The process requires only a few hours to complete it, and the material can be furnished, molded in a desirable form, and much cheaper than it can be cut from the quarry, even in the plainest finished style.

In railway carriages, drawn by any power external to the carriage and acting upon its body above the centers of the axles, the weight upon the forward wheels of the carriage must be greater when it is in motion than when it is at rest. The forward axle becomes a fulcrum upon which the action of the drawing power tends to lift a part of the weight otherwise supported by the hind wheels.

There were 30,000 stoves made at Cleveland last year, valued at $800,000, for which 8,000 tons of pig metal were used and 3,700 tons of coal and coke. One shop turned out 10,262 lineal feet of iron bridges, valued at $250,000.

Scientific Miscellany.

Carbon in Iron.—It is well known that there are two states in which carbon exists in solid iron: a state of chemical combination with the iron, and a state of merely mechanical diffusion through its mass. It is also known that the carbon existing in iron in the last-mentioned state is always in the form of graphite. Dr. Phipson has recently announced to the Academy of Sciences that he has discovered that silicium also may exist in cast iron either in a state of combination, or in a state of diffusion merely, and that, like carbon, when merely diffused through the iron, and not in combination therewith, it is always in the graphite form. He adds, what, if true, is of great practical importance, that upon the condition of the silicium in any given sample of cast iron depends, in a very great degree, the practicability of converting that iron into steel by the Bessemer process. He regards diffused or uncombined silicium as the least injurious, stating that while iron containing as much as three or four per cent. of *free* silicium can be converted into excellent steel by the Bessemer method, the presence of a very much smaller quantity of *combined* silicium will either render the iron containing it incapable of being converted into steel by that method at all, or will cause the steel produced from such iron to be so hard and bad as to be quite incapable of being worked. He promises to publish shortly a full account of his method of determining the condition in which silicium exists in iron, with details of his experiments upon the influence of that condition upon the results of the iron by the process referred to.

Refraction.—The determination of the refractive power of a body is often a valuable guide in estimating its chemical purity. The adulteration of essential oils may thus often be detected with ease, where it would otherwise be difficult to ascertain it. The results obtained by Dr. Wollaston, with an instrument invented by him for exhibiting this quality, gave the following:

Oil of Sassafras	1.536	Oil of Turpentine	1.475
Oil of Cloves	1.535	Rectified Turpentine	1.470
Canada Balsam	1.52	Oil of Almonds	1.470
Copaiba Balsam	1.507	Oil of Olives	1.469
Oil of Amber	1.505	Oil of Peppermint	1.468
Oil of Nutmeg	1.497	Oil of Lavender	1.467
Oil of Linseed	1.485	Melted Spermaceti	1.446
Oil of Lemons	1.476	Sulphuric Acid	1.435

Dr. Wollaston states that genuine oil of cloves possesses a refractive power of 1.535, but that some of inferior quality, which had probably been adulterated, had a refractive power of only 1.498.

Antiquity of the Vine.—Recent discoveries of fossil vines and grapes, along the banks of the Rhine, completely contradict the almost universal belief, which has heretofore attained, that the vine was introduced into Europe from Asia; and also carry the existence of the same far back into the early periods of geological history. Vine leaves, impressed upon coal and shales, have been found in the mines of Hesse-Darmstadt. Fossil grapes, have also been found there, nearly or quite identical with the wild varieties which are now growing upon the banks of that stream.

Extinct Animals of this Continent.—Prof. Leidz, of Philadelphia, has in course of publication a work of great interest, on the extinct animals of this continent. Among these are reckoned several which are now confined to Asia and Africa, such as the camel, the rhinoceros, the elephant and mastodon. The existence of these animals on the Western Continent is inferred from the fossil bones, particularly the teeth, of these animals, which are found in considerable quantities at the West. And the conclusion to which these fossils bring the savans, is, that this is really the *old* world, and the Eastern Continent is in fact the *new* world.

Truths of Science.—Nothing astonishes the earnest worker in science so much as to find the truth of nature was, in reality, like what in his ignorance he fancied it, or was anything less than wonderful.

A Fragrant Substance from Resin.—Mr. W. Skey has published the following: Common resin, lac or Kauri gum, in a state of powder, is gently heated with dilute nitric acid for a few hours; the mixture, or solution, as the case may be, is then evaporated to dryness, or nearly so, and treated with an excess of a strong solution of common soda, caustic potash, and lime in water; the resulting liquid is then transferred to a retort and distilled. At first the distillate has an odor of garlic, but this gradually gives way to an odor decidedly fragrant. On redistilling the portion last drawn over from concentrated sulphuric acid, a strong aqueous solution of this odorous substance is obtained; the solution itself has a warm aromatic flavor, and the odor assimilates to that of peppermint mixed with lavender. Bichromate of potash with sulphuric acid, also, may be used for the oxidation resin employed.

There is a species of fir tree in the Sierra Nevada, the gum from which, when distilled for turpentine, yields a highly fragrant substance, having a balsamic odor something like lemon peel. It possesses all the usual properties of turpentine except the odor. Considerable quantities were sold in this city, some three or four years ago, put up in small bottles, to be used for cleansing silks, woolens, etc. It was much preferred for that purpose to benzine or ordinary spirits of turpentine, on account of its pleasant fragrance. In fact it had some considerable merit for perfumery. Most likely the gum or resin of this tree, if treated after the above formula, would yield a much more valuable product than the simple distillate formerly prepared. We would commend the above suggestion to Mr. Fairbanks, of the Butte Turpentine Mills, who first discovered the peculiar gum to which we have alluded.

Oil Upon Water.—The following facts are important and interesting in connection with the article which we gave last week, in reference to pouring oil upon the water, at sea, to keep down the waves, and thereby remove the danger of shipwrecks:

"Drop a small quantity of oil into water agitated by the wind; it will immediately spread itself with surprising swiftness upon the surface, and the oil, though scarcely more than a teaspoonful, will produce an instant calm over a space several yards square. It should be done on the windward side of the pond or river, and you will observe it extend to the size of nearly half an acre, making it appear as smooth as a looking-glass. One remarkable circumstance in this experiment is the sudden, wide, and forcible spreading of a drop of oil on the surface of the water; for if a drop of oil be put upon a highly-polished marble table, or a looking-glass, laid horizontally, the drop remains in its place, spreading but very little; but when dropped on water, it spreads instantly many feet round, becoming so thin as to produce the prismatic colors for a considerable space, and beyond them, so much thinner as to be invisible, except in its effects in smoothing the waves at a much greater distance. It seems as if a repulsion of its particles took place as soon as it touched the water, and so strong as to act on other bodies swimming on the surface, as straw, leaves, chips, etc., forcing them to recede every way from the drop, as from a center, leaving a large, clear space."

Oxidation of Amylic Alcohol.—The following statement is made by A. Claus: Amylic alcohol, nitric acid having a specific gravity of 1.5, and water, were placed in a cylinder without being mixed. After the lapse of four months the smell of alcohol disappeared, that of amylic valerianate being substituted. The fluid was then diluted with water, and one-half of it distilled; the distilate was found to consist chiefly of ether. The residue, on further concentration, gave off nitric acid vapor, and, on cooling, crystals of oxalic acid were separated.

M. Blondlot asserts that when phosphorus produces ozone by its slow combustion in presence of water, phosphoric acid is produced, which, in contact with excess of phosphorus, is partly transformed into phosphorus acid.

A New Pigment.—Prof. Church has extracted from the brilliant red feathers of the bird known as the "plantain-eater," a new animal pigment, which he calls "turacine."

Silk—Now is the Time!

It appears that the silk-worm disease is spreading throughout Europe. The crop in France will this year be still inferior to that of last. Not only are the native eggs infected, but those of foreign production show signs of the disease. So writes a French silk-grower of experience to Mr. Louis Prevost, of San José, in this State. Mr. Prevost, whose name has been prominently before the public in connection with the silk-culture in California, and who takes a just pride in being known as the prime mover in the enterprise, has sent us a printed slip containing not only a translation of the letter above referred to, but also two of his own letters, recently published in the San José *Mercury*. He sets forth the case, and urges the silk-growers of this State to embrace the golden opportunity thus offered them; and establish upon a firm foundation a reputation,—thus far not doubted,—for raising perfectly healthy eggs. This done, a mine of untold wealth is open to them; for there is scarcely a limit to the sale; they may supply the world.

In order to do this, it is only necessary,—says Mr. Prevost,—to observe proper precautions in the management of the worms. The chief causes of the disease have been, *bad feeding*, and *crowding*. The worms which are the product of five or six ounces of eggs have been raised in a room which is perhaps only large enough for those from *one* ounce. Proper regard has not been paid to the *temperature* of the rooms devoted to the purpose; nor to the importance of a constant supply of fresh air. The worms, too, have been in some cases *fed with wet leaves*. This is wrong; the leaves should be gathered after the dew is off, and should be fed to the worms while fresh,—not faded, for then they become tough. Many other points must be carefully observed. Mr. Prevost refers to his *California Silk-Grower's Manual* for more full particulars; and quotes, in one of the above-mentioned letters, especially from page 228 of that book. We do not re-produce the quotation, for all our silk-growers are supposed to have the manual; but we give herewith, from the letter aforesaid, the items of instruction in regard to space, frequency of feeding, and temperature:

"For half an ounce of eggs,—which will produce twenty thousand worms,—the space required, in square feet, is, for the 1st age, 10 feet; 2d age, 20 feet; 3d age, 40 feet; 4th age, 90 feet; 5th age, 200 feet. The worms should be fed as follows: 1st age, from 12 to 15 times in 24 hours; 2d age, 10 to 12 times; 3d, 8 to 12 times; 4th, 8 to 10; 5th, about 8 times, but plentifully then. For the hatching of the eggs, begin with a temperature of 62° F., increasing during eight days to 82°; and come down gradually during five days from 82° to 72° or 74°, and keep them at that during the balance of the time."

Mr. Prevost alludes to the propriety of adopting a uniform plan for preparing the eggs for exportation, as is done elsewhere, and remarks that he has found card-boards of a good size and quality, thirteen inches long and nine and a half inches wide, costing only one cent apiece, which he thinks are the best that can be selected for the purpose. Those who desire it, will be supplied by him upon receipt of their orders, with the money.

Mr. P. repeats, with emphasis, that there is no fear of glutting the market with good healthy eggs. He has orders from France and Italy, to buy. He adds that some of the best French and Italian silk-growers are about coming to California, for the express purpose of establishing themselves in the business.

Not all Gold.—The domestic exports from this port, aside from precious metals, for the year ending June 30th, 1868, reached a total value of $16,400,458. Our exports of bullion and coin was $40,727,992. Our merchandise shipments consisted of some fifty different articles, mostly the products of the soil.

Mineral Resources of the Pacific Slope.—The increasing interest manifested in acquiring general information with regard to the mineral and other resources of the Pacific Slope, is most strikingly shown in the demand for publications containing that class of information. Within the past year, there have already been placed before the public a revised edition of Hittell's "Resources of California," Cronise's "Natural Wealth of California," J. R. Browne's Second Report, on the "Mineral Resources of the States and Territories West of the Rocky Mountains," and now we have announced, from the publishing house of H. H. Bancroft & Co., of this city, a reprint of the latter work, to which much additional cognate matter will be added; the whole forming an octavo volume of 900 pages, to be accompanied by a steel portrait of the author, by Halpine. The new matter which will be added to Bancroft's reprint of Brown'e report, will be as follows:

I. A complete history of the discovery of Lower California, and its settlement by the Jesuits; also, a Historical Sketch of the acquisition of Upper California by the United States, its progress and settlement up to the present time; by Dr. Alex. S. Taylor, of Santa Barbara.

II. An original translation of Clavijero on Lower California and the adjacent Mexican Territories; by A. Randall.

III. Exploring expeditions through Lower California, in 1867, by J. Ross Browne, Wm. M. Gabb, T. M. Löhe, and others.

IV. Land expedition of J. D. Hanks from Magdalen Bay to San Diego.

V. Topographical surveys and explorations of the Coast of Lower California; its Bays, Shores, Islands, Harbors and Inlets; by Capt. C. M. Scammon.

VI. Historical Sketch of the Settlement of Nevada, from the discovery by Col. Fremont, including the Mormon Settlements, notices of the Aboriginal Tribes, Political Events, etc., by Dr. H. De Groot.

VII. Historical Memoirs of Oregon and Washington Territory; by Elwood Evans.

An Improved Anchor.—Mr. Frederick Wittram, a lawyer of this city, has invented a new anchor for vessels, for which letters patent have been granted by the United States, and application has been made through the Mining and Scientific Press Patent Agency, for patents from European countries.

This anchor is simply a square bar of iron, having longitudinal openings made through it, one at each end, one passing through the bar at right angles to the other, in which the arms or flukes are placed, and pivoted at one end so that they will swing entirely through the bar from side to side and up and down, always keeping the two flukes ready to take ground. The bar is provided with rings at each end, to one of which the cable or chain is attached when the anchor is let go, and the other serves to cat the anchor when not in use, by attaching a cable to it and swinging it from the cathead, allowing the arms or flukes to hang within the body of the anchor or bar out of the way. This anchor can never foul, as there are no projections or obstructions to be met by the cable while swinging around with the tide, or by other means, while the operation of tripping it to cause it to take hold is perfect, as, when it falls, one or the other of the flukes on the side will cause the bar or body to turn sufficient to drop the other fluke from the opening on the opposite side, when they both take hold of the bottom and form a perfectly staunch anchor, capable of holding an immense weight.

The commercial public have lately been treated to several improvements on anchors, but this last appears to be an important addition to ships' safety apparatus. Several tests have proven it to be a success.

College of California.—The College of California opens its Fall term, on Thursday, July 30th. Instructions in the full course will be given as heretofore. New advantages will be provided in some of the departments. Those who wish to join any of the classes, may be examined on Wednesday, July 29th. An optional course will be provided for those who wish to study the natural sciences, mathematics, the modern languages and English language. Professor Rising will continue to give special attention to classes in analytical chemistry and assaying.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

Issued for the Week ending July 7, 1868.

79,581.—Improved Quartz Mill.—Alpheus Lewis, Virginia City, Montana:

I claim the train of gear wheels E, E, E, in combination with the series of stamps D, D, D, whose stems C, C, C, pass up through the eyes of the gear wheels E, and derive a constant rotation therefrom, substantially as and for the purposes set forth.

79,639.—Improvement in Gang Plow.—Gustavus A. Davison, San Leandro, Cal.:

1. I claim regulating the level of the machine by the device O, O', and set screw P, or their equivalents, substantially as set forth.

2. The rigid arms H, H', and G, attached to the axle and connecting the level or sweep J, either directly to the arm G, or by the link I, substantially as and for the purpose specified.

(The object of this invention is to provide an improved gang-plow.) It consists in a device for raising and lowering the frame, whereby the plows are made, to cut shallow or deep, or whereby they may be elevated entirely above the ground, when traveling from field to field. The invention comprises a jointed axle, regulated by a set-screw, so that one of the wheels of the machine may be adjusted to travel or rotate on the same plane with the other or land wheel. By this device for constructing and operating gang-plows, a great advantage and an important addition to the leverage power is obtained, by the driver, in operating the sweep for raising the plows entirely out of the ground, or regulating the depth in plowing.

79,666.—Improvement in Marking Cans.—Frank W. Marvin, Sacramento, Cal.:

1. I claim in combination with a marking can, the reservoir C, substantially as and for the purpose set forth.

2. The valve D, and tubular handle G, in combination with a marking can or pot, arranged substantially as and for the purposes described.

79,689.—Improved Cup for Effervescing Drinks.—A. Rottanzie, San Francisco, Cal.:

I claim in combination with the partition B, the stops or gates a, b, c, or equivalent device, and the lid or cover E, substantially as and for the purpose described.

The nature of this invention is to provide a cup to be used for effervescing drinks, such as result when seidlitz-powders are used, and the object thereof is to so arrange the cup that the two powders may be contained in two separate compartments of the same vessel, and from which they may be poured simultaneously into a spout, where they may meet and effervesconce take place. The liquid may also, by this device, be drawn from the mouth-piece, thus preventing the gas from escaping, and regulating the amount of the solution desired to be taken; as when sufficient has been taken, the remainder may be allowed to remain in their respective compartments, to be used at another time. The device also secures a far more thorough mixing and incorporating of the fluids when they have met in the spout, and consists of a series of stops or gates placed in the neck of the spout in any suitable position for arresting the flow of the mixture. The spout is furnished with a mouth-piece, from which the mixture may be drank, and a lid or cover may be so hinged to the cup as to fall down and cover the spout and a portion of the cup, so as to prevent the mixture from overflowing from too great effervescence. The cup may also be provided with a handle to render it convenient, and, when made of glass, it may be so marked with lines as to indicate the proper amount of water to be placed in each compartment, so that the two solutions shall be exhausted at the same time, while the flow and amount of gas may be regulated as desired.

79,763.—Improved Firemans' Extension Ladder.—Robert H. Jones, San Francisco, Cal.:

1. I claim the combination, in a fireman's extension-ladder of the sliding frames A, A^1, A_2, with the sliding telescope tube I, I^1, I^2, substantially as above described.

2. In combination with the extension-tube I, I^1, I^2, the reservoir J, provided with several supply pipes M, M, M, substantially as and for the purposes specified.

3. The rotating platform N, when used in connection with a fireman's extension ladder, substantially as and for the purposes described.

4. The sliding-bridge V, operated by the wheels T, Y, when used in combination with a revolving platform N, substantially as and for the purpose specified.

5. The combination of the carriage C, with the screws Z, Z, by which it is adjusted to a level when standing upon inclined ground, substantially in the manner described.

79,793.—Improvement in Spurs.—Samuel Wehrly, San Francisco, Cal.:

I claim the graduated holes b, b, b, or their equivalents in the sides of the band A, and the pin c, near the end of the spring E, for adjusting the spur to the heel, substantially as described.

New Incorporations.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

Metropolitan Boot and Shoemakers' Union.—Capital stock, $50,000; 500 shares, $100 each. Trustees: Robert Cobb, Fred. Fillimore, Peter Sheridan, Wm. Sullivan and Volney Howard.

Keystone Homestead Association.—Capital stock, $30,600; 51 shares, $600 each. Trustees: Henry C. Swain, Chas. W. Thomas and Wm. Corbett.

Land Investment Co.—Capital stock, $120,000; 400 shares, $300 each. Trustees: Wm. R. Wheaton, H. L. Davis, A. D. Grimwood, S. P. Middleton, J. S. Paxton, F. B. Wilde, H. F. Williams, John Archibald and James L. Blaikie.

The Hibernia Savings and Land Association filed its certificate to disincorporate.

The following articles of incorporation have been filed in the office of the Secretary of State during the past week:

Wisconsin M. Co.—Nevada Co. Capital stock, $320,000; 2,200 shares, $100 each. Trustees: John C. Coleman, Robt. Smith, Thos. Findley, H. Hoffman and William Launder.

Election of Officers.—Yellow Jacket M. Co.—July 20th. Trustees, Wm. Sharon, John B. Winters, Thos. G. Taylor and Chas. Bonner.

Gold Hill T. G. & S. M. Co.—July 18th. Trustees, O. Gori, P. J. Venard, F. O. Wegener, C. Martin, H. Huguet, H. Matz and R. Wegener; President, Camilo Martin; Secretary and Treasurer, R. Wegener; Superintendent, H. Huguet.

Wanted—At this office, the postoffice address of Enraght Massey, late of Gold Hill, Nevada.

Notice.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

TO THE PUBLIC.

Hear what Bussey has got to say in defence of his Lock:

Whereas, Certain parties in San Francisco and elsewhere, are conniving to destroy the reputation of the Bussey Lock, in order to establish other Locks in which they are interested; and

Whereas, It is asserted that a certain individual now in this city will put up $5,000 against the same amount, that he can pick the Bussey Lock in eight hours' time; but makes Bussey this generous proposition: That he does not wish to injure him in any way, and if he will pay a certain amount of money the Lock will not be exposed. Wants Money, is in the market at the highest bidder!

Now Bussey wishes it distinctly understood that he pays no man to keep quiet. Bussey's Improved Combination Lock will be on exhibition at the Mechanics' Fair, in competition with other Locks for the First Premium, and a challenge will be given then and there, to the world in general, and H. S. Folger in particular. The security of the Lock will be endorsed, in any amount, from $500 to $50,000. The man presuming to pick it will be required to endorse his skill in a corresponding amount.

3v17-4w

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Paint will not remove in five minutes. Whether a frightful Burn, a griping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers, or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.

G. H. MOORE, Inventor and Sole Proprietor, 652 Market street, San Francisco, Cal. 21v16-3m

---

Save Your Teeth.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, July 23, 1868.

City Stocks.

Little attention is at present given to miscellaneous securities through the operations of the Board. The market seems to be yet too limited for large Board transactions of this character, and so long as mining stocks retain their present prominent position as means of investment, upon which larger and speedier profits can be realized, the dealings will necessarily be greatly restricted. During the week sales of California Steam Nav. Co. were made at 70 per cent.; Spring Valley at $60 @66 50; San Francisco Gas stock at $77@70 50. The Hibernia Savings and Loan Society pays a semi-annual dividend of 10 per cent. per annum out of the earnings for the first six months of the present year.

We herewith present our usual semi-annual reports of the Savings and Loan Societies of this city in the same tabular form as originally published by us for the past two and a half years, with the aggregates of the several terms over which our report extends appended. It is gratifying to note the increased thriftiness of our population. It will be observed that the deposits have trebled within the past two and a half years, rising from $7,000,000 to nearly $20,000,000. We can safely estimate the funds in the possession of similar institutions in the interior—at Stockton, San José and Sacramento—at $1,500,000, giving a total of $22,200,000 to the credit of the eleven California Savings Banks now in existence. The deposits now held by the San Francisco savings institutions, apportioned to the number of depositors, would give to each the sum of $755.

NAME.	Date of Organization.	Open Deposit Accounts, June 30.	Deposits.	Loans.	Gross Earnings.	Reserve Fund.	Expenses and Tax.	Gross Profits.
Hibernia Savings and Loan Society	April 7, 1859	12,160	$9,630,089 29	$9,425,560 94	$111,001 97	$309,148 05	$34,597 77	$247,247 43

The receipts of the local insurance companies during the month of June and previously this year, according to the returns made to the Internal Revenue Department, have been as follows:

	June.	Previously this year.	Total.
Pacific	$54,537	$314,020	$368,557
Union	26,508	171,706	198,214
National	.....	201 253	201,253
Fireman's Fund	16,551	96,734	113,285
Builders'	24,375	96,701	121,076
California	19,228	56,842	76,070
Merchants' Mutual Marine	18,446	79,281	97,727
Occidental	10,464	30,131	40,595
Home Mutual	14,080	46,093	60,173
San Francisco	3,568	22,408	25,976
Peoples'	6,617	31,817	38,434
Totals	$194,974	$1,146,984	$1,341,958
Same time in 1867	176,965	877,292	1,054,257
Increase in 1868	$18,009	$269,692	$287,701

The returns were made upon a legal tender basis, the rate—72 cents for January, 71 cents for February, 72 cents for March, April, May and June—being fixed every month by the Assessor of the district.

The National and San Francisco have disincorporated and their outstanding risks have been transferred to the London and Liverpool and Globe Insurance Company.

The above statement shows a decrease of $38,009 as against the receipts in May. The receipts of the several companies in June, as compared with May, show the following difference:

	Increase.	Decrease.
Pacific	.....	$6,074
Union	.....	4,885
Fireman's Fund	.....	2,017
Builders'	828	.....
California	10,568	.....
Merchants' Mutual Marine	7,826	.....
Occidental	3,664	.....
Home Mutual	1,361	.....
San Francisco	43	.....
People's	60	.....

The receipts of the city railroads for the month of June and previously this year, have been as follows:

	June.	Previously this year.	Total.
Omnibus	$26,854	$120,065	$146,919
North Beach & Mission	23,625	105,915	129,540
Central	14,536	66,256	80,792
Front Street, Mission & Ocean	8,678	39,756	48,434
Market Street	10,473	39,021	49,494
Potrero and Bay View	2,786	7,780	10,566
Totals	$86,952	$378,823	$465,735
Same time in 1867	70,592	305,223	375,815
Increase in 1868	$16,360	$73,600	$89,960

Showing an aggregate increase of $751 in June over the receipts of May. The receipts of June as against May show the following difference:

	Increase.	Decrease.
Omnibus	$126	.....
North Beach and Mission	439	.....
Central	.....	508
Front Street, Mission and Ocean	.....	344
Market Street	93	.....
Potrero and Bay View	946	.....

The receipts of the San Francisco and San José Railroad were $51,423 in June against $59,823 in May; San Francisco and Oakland Railroad $16,832 50 against $23,227 in May. The receipts of the San Francisco and Alameda Railroad for June amounted to $11,525 53.

Mining Share Market.

The mining share market, since our last similar reference, has been somewhat irregular up to the 22d inst., since which time a general improvement has taken place, and transactions in the Board have been considerably augmented. The following is our resumé of information regarding the various claims:

Savage—Increased in activity toward the close of the week, declining from $139 to $128 50, improving again to $139, and at the close realizing $138. During the week ending July 18th, 1,480 tons of ore were extracted, showing an average assay yield of $39 47; previous week, 1,351 tons, valued at $41 31 per ton. The product during the week under review came from the following points: Third station, north mine, 181; fourth station, north, 90; fourth station, south, 1,024; fifth station, north, 21; and fifth station, south, 164 tons. They are now cross-cutting in the south mine, on the fifth station, and the developments are reported to be looking well. The Hale & Norcross line, it is said, has been reached, and there is some talk of the drift being carried forward by the latter company from the Savage ground. The bullion receipts to date for July account aggregate $148,500, being about $50,000 less than same time last month.

Yellow Jacket—sold to a larger extent and at extremely fluctuating rates, dropping from $1,230 to $1,030, rising quite rapidly to $1,280, and at the close selling at $1,175. We clip the following from the *Trespass:* Sinking and drifting are going on with the usual energy. The 700 level is now looking well, and station timbers were being put in for the 800 level on the 13th inst. In connection with the Kentuck and Crown Point, a waste dump is being constructed, with a railroad leading therefrom to an unoccupied ravine, half a mile away, for the conveyance of the waste, which would soon have been a serious drawback to active operations with the three mines.

Hale & Norcross—has been unusually active during the period under review, over 6,000 shares having changed hands in the Board, dropping from $72 to $54, advancing to $82, and at the close selling at $76. Work to ventilate the lower levels is now vigorously prosecuted. So little can at present be reported about this mine, that it is thought interested parties are urgent in their endeavors to depress the stock; as for ourselves, we never experienced any difficulty in obtaining information from the office whenever desired. Outsiders have it that they intend to carry forward the drift from the Savage claim on the fifth station, etc., and, in fact, "outsiders" seem to know more than "insiders." An assessment of $10 per share, or $200 per foot, was levied on the 22d inst.

Kentuck—declined from $387 50 to $360, rose to $380, and closed at $375. The receipts of bullion to date for July, show a yield of $52,986 66. The shaft is upwards of 630 feet in depth, and when 700 feet are attained they will drift for the ledge....Imperial receded from $123 to $100, improved to $110, and closed at $108. No change from our previous report. Receipts of bullion to date for July account, $23,405 37.

Crown Point—was in good request, declining from $94 to $82, advancing to $88, and at the close selling at $88 50. The stopes between the 700 and 800 levels are yielding their usual quantity and quality of ore. The satisfactory manner in which the breasts are holding out on this lowest working level, says the Superintendent, gives assurance that the 900 level will prove at least as good, if not better, than any level we have worked. On the 24th the drift from the 900 level was in 74 feet, running in hard rock. The bullion receipts to date for July foot up $37,842 92.

Chollar Potosi—fell from $185 to $125, rose to $165, and closed at $145. For the week ending July 17th, extracted 1,060 tons of ore against 820 tons the previous week. The Blue Wing station furnished all. The drift from 1,000 level has been carried in thirteen feet, and that from the 1,100 station twelve feet, both running in porphyry and clay. The ore slip of the 21st shows a yield of 134½ tons, and that of the 22d, 168 tons.

Alpha—declined from $45 to $36, rallied to $45, and closed at $43. On the 22d inst., had drifted 67 feet from the shaft on the 250 level. The ground was loose, and the drift was running in white quartz....Sierra Nevada varied little during the week, selling at $28@29, and at the close realizing $33. They have found good ore sixty feet from the surface that will pay $30 to the ton. The extent of it is not yet known.

The sales in the Board during the past week have been as follows: Open sessions, $647,625; regular sessions, $1,693,868—total, $2,241,493.

Price of Copper.—The market price of ingot copper, in New York at latest overland dates, was from 23 to 24 cents. The market was easy, with free arrivals from the Lakes.

What Next?—We understand that a select library is about to be opened at Woodward's Gardens,—thus adding a new feature to its other varied attractions.

Notice.—If Mrs. E. J. Baldar, of Contra Costa County will call at this office, she will learn something to her advantage.

Those wonderful Brazilian Pebble Spectacles of Muller's, 205 Montgomery street, are made on truly scientific principles. *

The Hancock Sewing Machine.—This is a small machine, sold at $6, which has just been introduced here. It is simple in its construction, easily and inexpeneively repaired by any watch-maker, if it should—by any of the accidents liable to sewing machines—get out of order. It makee the chain or embroidery etitch, throwing the chain upon the *upper side* of the cloth, and seems peculiarly adapted to embroidery and work on muslin goods. It occupiee but little space, each machine being put up in a neat box six by eight inches in size, and accompanied with full directions for its use. It is a nice present for a girl, and can be appreciated by any lady who has not already secured this indispeusable implement—the sewing machine. Messrs. Fuller & Co., 109 Montgomery street, are the agents for the Pacific Coast.

Through Colorado.—Our former fellow citizen, P. M. Randall, Esq., has just returned to New York from an extended trip made through the mining regions of Colorado, in the interest of the firm of Morey & Sperry, mining machinery agents, No. 95 Liberty street. Our readers may expect to receive some information gained by the observations of our California traveler.

Telegraphic Communication with Panama.—The proposition to lay a telegraphic cable from the Isthmus of Panama is meeting with much favor from business men on both sides of the Atlantic. Soundings and other observations are now being made with the view of estimating its feasibility and probable expense. Such a connection is greatly needed by the commercial world everywhere.

The Steam Plow.—The Contra Costa *Gazette* says that Coffin & Standish's new steam plow was recently tried to test its traction powers. It moved over uneven and hilly ground at a rate of about three miles per hour, running with equal facility either backward or forward, up or down hill, on the instant of reversion of motion, and handling in the readiest manner with the steering gear. Nothing could be more satisfactory than its workings upon these trials.

Empire Mill.—Captain Lee, the enterprising superintendent of the Empire mill, Grass Valley, says the *National*, has just completed a contract for a magnificent engine of 150-horse power; cylinder 18 by 42 inches. The engine is to be used for pumping, and will cost $10,000.

Our Wheat Crop.—It is estimated, by good judges, that our present wheat crop will reach the enormous amount of 20,000,000 bushels against 11,500,000 bushels, which was thought enormous for last year. Verily we are progressing.

Treasure Drift.—The treasure shipments from this city since January 1, 1868, have been $21,675,824. For the same period last year it was $21,749,750—a falling off the present year of $70,925.

A Good Sign.—The Board of Supervisors have passed a resolution, granting to the Women's Coöperative Union permission to erect a business sign at No. 39 Second street.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, July 11th: The Pennsylvania Co. made 20 feet of tunnel last month, making the whole length of tunnel 769 feet. A small vein of quartz showing ruby silver all through it, was struck.

The Tarshish and Morning Star mines in this county, have each as large a ledge and as much millable ore in the mine as any mine on the Comstock, and the I X L—though not so large a vein—has richer ore than any on that model ledge.

Amador County.

Jackson *Ledger*, July 18th: Phil. Seibenthaler's quartz mine, on Foster's Ridge, above Volcano, is now down over 75 feet. The ore continues good, and the size of the lode has considerably improved. Phil. keeps an 8-stamp mill running, and the prospects for a fine mine are daily improving.

Ike Eastman & Co. have opened a mine on the same range that prospects very well. They have just completed a fine, large arastra, and are crushing ore. This mine is a half mile north of Fort John.

Butte County.

Record, July 18th: The miners at Kimshew have plenty of water, and are in good spirits over their prospects. Some claims are cleaning up and are doing well. L. A. Snow has got his water power derrick in operation, and it works to a charm.

Kern County.

Havilah *Courier*, July 11th: Rand's mine, three miles distant from Havilah, is being doveloped very successfully.

Los Angeles County.

News, July 14th: Dr. Winston has sent up to San Francisco, per steamer Orizaba, a lot of silver ore from the Zapata mine, situated on the San Gabriel River. The ore is very rich, and will no doubt astonish some of the wiseacres who think we have no mines in Los Angeles County.

Mariposa County.

Gazette, July 17th: A rich quartz vein has been discovered within about a mile and a half of Lovejoy's sawmill.. The owners are Williams, Fine, Harbour, and others. We are told that the vein is very large, and the prospect big for a fortuue.

The quartz mill known as the Fremont mill, near Bear Valley, was burned on Sunday last. The mill had been running the day previous, and it is supposed that the fire caught from ashes thrown from the furnace too near the wood pile. The mill was valued at from $15,000 to $20,000; insurance, $5,000.

Mail, July 17th: An exceedingly rich gold quartz lead has been discovered on Buckingham Mountain, 12 miles from this place. The vein is about five feet in thickness. We have examined specimens of the rock, taken at random, the appearance of which satisfies us that a big thing has been struck.

Another rich strike is reported to have been made near Carriboo, in this vicinity. Our friend Murphy has sent us a lot of rich ore and specimens from the locality of Kerrins & Bogan's quartz mill.

Nevada County.

Alpine *Miner*, July 11th: The Elmonton claims, located near the North Star Co's mine, Nevada County, were lately sold to the latter company for the sum of $30,000. These claims were 1,000 ft. in extent, and very little work has ever been done on them. The whole cost of the Elmonton claims to those who recently sold them would not foot up to over $800.

Grass Valley *Union*, July 15th: The Idaho Co. is taking out good rock. The shaft is 82 ft., and the ledge is large.

A clean-up from the Union Hill mine was made day before yesterday, after a five days run, and the sum realized was over $3,000. This was larger than any of the owners anticipated, as the rock crushed was not of the best class.

The North Star mine continues to do well, and a large clean-up will come off next Monday.

Eaton's mill is to be removed to the Greenhorn ledge, which is about five miles from Grass Valley. The ledge has been rich heretofore, and late prospects from there justify the owners in putting up machinery.

July 17th: Thirteen loads from Henderson & Autrey's ledge, on Woodpecker Ravine, yielded $13 per load. The Ben. Franklin ledge has 50 loads crushed, which yielded over $45 per load.

July 18th: Yesterday there was brought to town some exceedingly rich rock from the Easley ledge, about a mile east of this place. The rock came from the bottom of the 90-ft. stope, and about 20 tons have been taken out, all through which gold is plentifully distributed. The rock will come near to the thousands per ton in yield.

Transcript, July 17th: We saw some very rich specimens of quartz from the Banner mine, which were taken out yesterday. The rock is of a bluish cast, and the pure metal can be seen in every part of it. The Banner is now yielding excellent returns.

In every part of the county the miners have abundance of water, and are taking out large amounts at every clean-up. The yield of quartz mines has greatly increased.

July 21st: Kaiser & Co. have located 1,000 ft. on the extension of the Garden City ledge, Grass Valley, and organized the Nevada Mining Co., for the purpose of working the claim.

Slatliff & Co. have located 1,860 ft. of ground for hydraulic mining at Liberty Hill, Little York township, between Steep Hollow and Bear river.

Gazette, July 16th: Capt. Lee, superintendent of the Empire mine, has just completed a contract for a magnificent engine 150-horse power; cylinder, 18 by 42 inches. The engine is to be used for pumping, and will cost $10 000.

July 20th: A company has been engaged for several years past in running a tunnel for a gravel channel at Grizzly Ridge, near Pattee & Co's quartz mill. Last week the company reached the gravel in their tunnel, and found excellent pay.

Placer County.

Enquirer, July 11th: The Dutch Flat, one of the oldest claims in this section has made its final run. The ground is worked out on the present level. We hope that its owners will immediately commence prospecting for the blue lead. The last run was a good one; averaging nearly $200 per day.

Plumas County.

Downieville *Messenger*, July 18th: A correspondent writing from Port Wine, says: The Sore Lip Mining Co. purchased a tailing claim of Doc. Slocum, some time ago, and have done very well.

The Never Sweat Co. are hard at work on the claims down on Jackass Point, previously owned by McLaughlin & Harkins, The cement is very hard and plenty of it, and it requires muscular boys to face it. Dump Shed cannot be beaten in this State, on smashing boulders and cement. The boys are improving their time, as the water season will not last long.

Sierra County.

Downieville *Messenger*, July 18th: The American claims at Morristown, owned by Tom. Smith & Co., are now working about 60 men, and doing very well.

A correspondent writing from Forest City, says: Messrs. Gregg, Wade & Co. have struck good pay in their claims. They have reached an old channel, with an abundance of gravel. The gold is coarse and smooth, with pieces of considerable size. With the claim but partially opened, and with but indifferent means for working it, they realized from $6 to $10 a day to the hand.

The Brush Creek mill is being pushed forward rapidly, and will soon be finished. It will be a first class mill, to correspond with the richness of the mine whose rock it will crush.

Everything around the Union ledge, in French Ravine, is going forward favorably.

Shasta County.

Courier, July 18th: Botsford & Higinbotham are at work on their quicksilver claim, at South Fork, and are meeting with the most flattering prospects. As much as a pint of pure quicksilver is often taken out of crevices in the rock at one time. There is no doubt but that this mine will prove very valuable, and its discoverers will realize fortunes in a short time.

Dr. Gibbon, of San Francisco, lately visited this county to examine into the feasibility of constructing a large ditch to take water from the North Fork of Cottonwood to the placer diggings in and around Piety Hill. The cost of the enterprise has been estimated at $60,000.

Siskiyou County.

Yreka *Union*, July 11th: A company of prospectors will meet at the camp of Fairchild & Doughton, on Lost River, on the 25th of this month, and will then organize and start for the headwaters of Sprague River, for the purpose of prospecting for the precious metals. This is a movement of considerable importance, and some of our best citizens are interested in it. The opinion obtains very extensively that there is a section of country off to the east of Klamath Lake, and north of Goose Lake, which is rich in gold. This opinion is based on reports made by parties who pretend to have passed through that district and prospected to a limited extent, and also on the known character of the region. Heretofore it has been impracticable to stop in that country on account of the hostility of the Indians, but now, owing to the presence of a large body of troops, under that indefatigable Indian fighter, General Crook, it is thought a company of 20 or 25 men will be perfectly safe.

Stanislaus County.

Sonora *Sentinel*, July 18th: A correspondent says: All that is lacking to make La Grange one of largest and richest placer mining districts in the State, is water, and it is hoped that the Tuolumne Water Co. will extend their ditch so as to lead the water to that place.

Solano County.

Press, July 15th: The Evans claim at Buckeye Hill, in Bridgeport, owned by Stidger & Co., are yielding large profits.

Trinity County.

Weaverville *Journal*, July 4th: Henry Potter & Co. have finally found it to the tune of an ounce a day to the hand, in their claims on Egan's Bar, half a mile below Junction City. They are certainly deserving of success, having worked without ceasing for 23 months to get their claim open, during which time they have cut a deep bedrock ditch 1,033 feet in length.

July 11th: Wilt & Driver's claims, at Park's Bar, is one of the richest ever opened on Trinity River, and the owners can take out at least $30,000 this year if they desire. This is one of the good results attending the opening of McGillivray's ditch from Cañon Creek.

July 18th: A gold-bearing quartz ledge of extraordinary richness has recently been discovered by Henry Engle and other parties, on Rich Gulch, a tributary of the lower East Fork. Specimens have been received here which, from outward appearance, are as rich as those taken from the famous Ish lodo, years ago. The ledge is only a short distance from the Ludwig ledge, which was partially prospected in 1864. Much excitement prevails at North Fork over the discovery, and we shall not be surprised to hear that a rich and extensive ledge has been discovered, having always entertained the belief that it would eventually be found in the Rich Gulch section, if anywhere in the county.

The mines along Cañon Creek are yielding well, and from appearances, we should judge that considerable prospecting is being done. There is undoubtedly a great range of unopened mining ground between Pennsylvania Bar and Red Flat. Many new comers have located along the creek the present season, and there is room for many more if they bring industry and perseverance with them. We saw at Gilzeau's a handsome $40-specimen taken from Dick Berkley's claim, which had been pronounced worked out. Wolff and partner have a rich paying claim between Red Flat and Pennsylvania Bar.

Tuolumne County.

Democrat, July 18th: The new mill erected on the Crœsus mine is a magnificent structure. It is constructed for 20 stamps. One hundred tons of first-class rock is ready for crushing.

The big flume on the Golden Rock ditch fell on the 9th inst. This flume spanned the Big Gap 12 miles above Big Oak Flat, and was the most stupendous and magnificent structure of the kind in the State. It was 3,200 ft. long, and 280 ft. high from the deepest part of the gap. It was a suspension, the wire cable being supported by 13 towers, built at regular intervals in the gap, and was built in 1859 by Messrs Holt & Conrad.

The Golden Rule mine has a fine 15-stamp mill, which is kept running night and day, and crushes about a ton to the stamp. The entire vein, from 7 to 9 ft. wide, is hoisted and crushed. The rock pays, uniformly, about $10 per ton, and last month the mine cleared $5,000 over all expenses.

ARIZONA.

San Francisco *Alta*, July 17th: The copper ore brought up here a few days since, by Wm. Thompson, Supt. of the Great Central mine, Arizona, taken from that mine at a depth never reached before, has been assayed and found to yield over 60 per cent., about three times as rich as that taken from the surface.

Miner, July 4th: Mining is dull just now. Very few arastras are running, on account of scarcity of water.

The Vulture is a great mine, and the deeper it is sunk upon, the riches it grows.

BRITISH COLUMBIA.

News, July 12th: At Carihoo the claims on Williams' Creek, Mosquito Gulch, Conklin Gulch, Red Gulch, Stout Gulch, Antler Creek, Steven's Creek, Begg's Gulch, and Little Lake Creek, are all paying handsomely. Fifty Chinamen are at work in the latter place, and are making from $5 to $7 per day to the hand.

At Williams Creek—Forest Rose Co. washed up for the week, 213 ozs.; Lillooet, 100 ozs.; Sheepshin, 150 ozs.; Baldhead, 95 ozs. Mosquito Gulch—Minnehaha, 348 ozs.; Willow, 165 ozs.; Hocking, 453 ozs., and Point, about 100 ozs. Couklin Gulch, Renfrew Co. washed up 53 ozs. Stout Gulch—Taft Vale, 150 ozs.; Muchu Oro, 86 ozs.; Jenkins, 50 ozs.; Alturas, 50 ozs., and Floyd, 27 ozs.

COLORADO.

The Cimarron river is a branch of the Arkansas, and rises in Huerfano county, Colorado, on the eastern slope of the Rocky Mountains. Its course is easterly, winding several times across the parallel of 37°, which forms the boundary line between Colorado and New Mexico.

Rocky Mountain *Herald:* The Cimarron mines will afford a profitable field for thousands of miners after the ditch water is available on flats and patches. The fact is fully settled in the minds of all the bona fide miners on the Moreno and Cimarron generally.

J. F. Robinson has sold out his mining interests on Willow and Last Chance for $13,000.

On New Orleans Flat, five men working a sluice, took out $1,000 in a single 10-hour run, week before last. The pay streak was only down about eight ft. from the surface.

As an average fact, 300 miners actually working throughout the Moreno mines are doing well, and may be said to average an ounce a day to the man—after they get down to the pay streaks, which are generally eight to ten ft. below the surface.

The chief mining is with sluices; except in Willow and Grouse Gulches, where there are a couple of hydraulics.

Mining claims on several of the gulches can be bought, rented, or worked, by whoever wants to work, quite reasonably.

Near Ute City the new quartz lode lately discovered by Mr. Maxwell, assays big, turns out quartz specimens perfectly speckled and saturated with free gold.

July 1st: In Granite district Mr. Royle has started up his 9-stamp water mill on quartz from the Yankee Blade lode. This company have 30 cords of surface quartz out, which prospects very rich. As yet they have only reached a depth of 40 ft.; at that depth the pay material holds out well.

Morrisou's 10-stamp steam mill is about completed, and will be running about the first or the middle of the coming month. Mr. Fullerton has a 10-stamp mill, built by Hendrie Bros. at the Eureka Foundry, on the road in. Parties are at work on the Magneta lode. At a depth of 25 ft., they have a 2-ft. crevice of fine looking free quartz. Mr. Tappan, of Boston, has purchased a one-fourth interest in the Five-Twenty lode, and has a 10-stamp Gates mill *en route*, which will be set up in California Gulch. This company now have out in the neighborhood of 60 cords of quartz, and are still developing the lode. The former owners have sluiced out as high as five ozs. of gold per day, three men working. On California Gulch they have just got their claims in running trim. Mr. Thos. Wells, who is running two hydraulics and ground sluicing, is taking out at the rate of $12, gold, per day to the man. Parties sluicing on the side claims of California Gulch, had taken out $1,000, gold, in two weeks' time. The gold production this season of Lake and Park counties, will average 1,000 ozs. per week, throughout the mining season.

The Apex lode, situated on Saxon Mountain, Clear Creek county, is said to be one of the strong silver veins of that locality. A shaft has been sunk to a depth of 18 feet, which shows a crevice of four ft. between walls, with an ore vein of from seven to ten inches of sulphurets. A fair assay shows the ore to contain $800 per ton. This was a chance specimen, but the entire vein of mineral would yield a sufficient quantity of silver to pay handsomely for working.

July 8th: The La Crosse mill, Nevada, started up yesterday. This mill has been idle—until this spring—for some time.

Barham Miller & Co., since the erection of a new whim on claim No. 1 east, on the Bates or Hunter lode, have been sinking their claim to a greater depth. Their last clean up gave them at the rate of nine ozs. gold to the cord.

Shaughnessy, Lee and Connor are still working the Kansas slide, in Nevada. They are now working the claim with great success; sluicing out never less than one oz. of gold per day to the man.

Richard White cleaned up last week 42 ounces of very nice Russell Gulch gold, which he sold to Warren Hussey & Co. Uncle Dick says that his claims are panning out better this summer than they have since '62.

There is an active demand for both gulch and lode miners. Ruling wages $3.50 and $4 for gulch miners, and $3.25 and $5 for lode miners. There is not a company operating on Russell or Lake, but are not running light handed.

Mr. Old is collecting in the interests of the British and Colorado Mining Bureau, London, Eng., specimen ores of all our mining lodes.

Denver *News*, July 8th: Black Hawk is recovering its old prosperity. The mills are all at work; have had and will have before long, an addition of six or eight to their number.

During the month of June, just passed, $130,000 worth of gold and silver was shipped East by the office of Wells, Fargo & Co., $8,000 or $10,000 of which probably came from the Cimarron, the rest produced by Colorado.

At Hussey & Co's, this morning, were nine bars of gold bullion, weighing 312.-33 ozs., valued at $5,390 in coin. At the First National were eleven bars, weighing 550 ozs., and valued at $13,757 in coin. At the Colorado National were 87 ozs. of dust, valued at $1,500 in coin.

IDAHO.

World: Geo. C. Robbins has the survey of his great War Eagle Mountain tunnel completed. Its entire length will be 8,067 feet, and its greatest depth 1,340 feet. It will tap or penetrate 15 well-defined good-paying ledges—among them the Poorman, Ida Elmore, Golden Chariot, Oro Fino, Silver Cord, and War Eagle.

MONTANA.

Helena *Post*, July 10th: At the Gold Creek mines on Bratton's Bar, in Pioneer Gulch, ten claims are worked by means of hydraulics, and are paying from $1,500 to $2,000 per week, with six men working.

Mining operations in the Silver Bow country are very active. One of the most important enterprises in that quarter, is the large ditch being constructed by Messrs. Searles, Harris & Owen. This ditch will convey 800 inches of water from Basin Gulch, a distance of 16 miles, to very extensive mining grounds in the vicinity of Silver Bow. Pioneer, I X L, Herring's, Morgan's, and fourteen other gulches, besides numerous bars, will thus be supplied with an abundance of water.

At French Bar, on the 1st inst., the Canard Co. cleaned up, after a 48-hours' run, with four or five men at work, $1,900.

On Indian Creek, at Cheat 'Em, the May boys, five in number, are cleaning up from $350 to $400 per day. The Steele boys are doing equally as well on claims adjoining. A new discovery has recently been made on Indian Creek, about seven miles above Hog 'Em, which is attracting much attention. The diggings are deep, and prospects of from 25 to 60 cents to the pan have been obtained at a depth of 40 feet, and these results are obtained without reaching bedrock.

The old miners on the lower part of El Dorado Bar are making from $10 to $12 per day to the hand.

Rich pay has been struck at the upper end of New York Gulch. Tunnels have now been run to it, and prospects of forty cents to the pan have been obtained on the claims of Apple, Wilkes & Co. The bedrock is from 40 to 60 feet below the surface.

At Cane Gulch, 50 men are now employed. The average pay which is being obtained by the miners is from $15 to $25 per day to the hand. About 18 companies are at work upon the bar, which is not yielding less than $5,000 per week.

Now diggings were discovered about the middle of last week between the head of Crow Creek and the divide of Boulder, about 12 miles from Radersburg.

At Georgetown, near Trinity, one day last week, Vandine, Peck & Co., cleaned up from a single day's run with two men shoveling in, $200.50. On several other occasions they have cleaned up $180, with the same number of men, and in the same length of time. Nearly all the other claims are worked by means of ground sluices, and are paying on an average, $10 a day to the hand.

At Diamond City, King & Gillette's bedrock flume being provided with an abundance of water, is progressing finely. It is expected that work will be resumed in the main Confederate Gulch, in a month or six weeks. From Capt. Hill's claims, on Last Chance Bar, immense quantities of dirt are being washed away by means of hydraulics. It is expected to scrape up a rich harvest of gold from the bedrock at the proper season. On Gold Hill, some $3,000 were cleaned up about ten days ago, after a short run. In Montana Gulch the great flume has reached bedrock, and the powerful hydraulics are washing down the golden sands at a rapid rate. Just below the mouth of Cement, in the upper portion of Confederate Gulch, the ground has recently been proved to be exceedingly rich. One hundred feet of ground situated in that vicinity, lately sold for $2,800. A claim just below that last named, was sold about a month ago for $1,800. The purchasers ran a drift nine feet in length, and in that short distance took out gold enough to pay for half of their purchase.

NEVADA.

Esmeralda.

Aurora *Union*, July 11th: The Palmetto Co. have now upon the dump from 500 to 1,000 tons of good milling ore. The foundation of the mill is completed, and in a very short time the company will be shipping bullion.

Pahranagat.

Virginia *Trespass*, July 18th: The mill of the Hike Co. is being repaired. The Pro Rata Co. have struck a ledge 14 feet thick, yielding handsomely.

Reese River.

Reveille, July 7th: We saw at the banking house of John A. Paxton & Co., a piece of chloride ore obtained from the Keystone claim in the district of White Pine, which weighs only about 30 pounds, and yet its value is upwards of $150. The piece is a mass of horn silver, which may be easily indented or scraped by the finger nail. We were informed that the owners of the Keystone have taken out of their ground a number of tons that will yield in the mill from $800 to $1,000 per ton; and that a selected lot of 20 tons would yield as high as $2,000 per ton.

In the South American mine a fine vein of ore has been struck at the depth of 300 feet, in the level extending south.

July 11th: Six tons of ore from White Pine assayed an average of $1,376 per ton.

Yesterday afternoon some 3,500 ounces of crude bullion were brought into the city from the Monte Cristo mill, in the district of White Pine.

For the five days ending yesterday, the Manhattan mill produced 17,908 ozs. of crude bullion.

During 23 days of the quarter ending June 30th, 71 tons of ore from the Hidden Treasure were reduced at the 5-stamp mill of the Monte Cristo Co., in the district of White Pine, which yielded an average of $120.21 per ton.

To-day David Lundbom received 3,410 ozs. of crude bullion for melting and assaying.

July 13th: During the month of June the Manhattan mill reduced 541½ tons of ore, which yielded $124,501.23.

July 14th: Men are rushing to White Pine as though that was their last chance.

The last three days run of the Combination mill yielded bullion worth $9,000.

Silver Bend *Reporter*, July 15th: A correspondent writing from White Pine says: The Virginia, Keystone and Eberhardt are the only rich *pockets* worthy of mention. I have never elsewhere seen as rich pockets of ore as I saw in the above named mines. The famous Hidden Treasure mines No. 1 and 2 are also situated on the south side of Treasure Hill.

July 18th: In Bonanza, the El Dorado South, owned by Leon & Co., has 100 tons on the dumps which will yield $125 per ton, and 100 tons which will yield $250 per ton—aggregate value $37,500, as the result of the labor of 10 men for one month. The average thickness of the vein is 30 ft. It is the richest mine in Nye county, and of more value than all the deposits at White Pine.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Gold Hill *News*, July 15th: The old Chollar works are being overhauled and put in working order.

The Pacific Mill Co., Lower Gold Hill, yesterday received a fine new engine.

Gold Hill Branch Assay Office of E. Ruhling & Co., received this morning for melting and assay, 11,511 ozs. crude bullion.

C. Wiegand & Co., of Gold Hill, received this morning for melting and assay, 2,090 ozs. crude bullion.

There were shipped from Wells, Fargo & Co's Gold Hill office this morning 14 bars of bullion, weighing 1,031 lbs., and of the assayed value of $28,305.31.

July 18th: The Rhode Island mill at Gold Hill, belongs to the Crown Point Co., and runs entirely on ore from that rich mine, reducing last month 1,800 tons, or at the rate of 60 tons per day.

The following is a statement of the amount of bullion shipped or received for assay during the past week: From the office of Wells, Fargo & Co., in Gold Hill, there were shipped 4,032 lbs. of assayed bullion, valued at $113,039.49; from their office in Virginia, 6,095 lbs., valued at $171,358.82. The amount of crude bullion received for melting and assay is as follows: E. Ruhling & Co., of Virginia, 20,082 ozs.; Leopold Kuh, of Virginia, 1,243 ozs.; W. C. Bousfield & Co., of Virginia, 27,020 ozs.; Gold Hill Branch Assay Office of E. Ruhling & Co., 38,222 ozs.; Wiegand & Co., of Gold Hill, 23,299 ozs.

The Sunderland is a 10-stamp mill, and reduced during the last month 850 tons of ore. With its very superior methods adopted for extracting the precious metals and the concentration of sulphurets, ore is evidently worked closer in this mill than any other in Gold Hill.

Gold Hill Branch Assay Office of E. Ruhling & Co., received this morning for melting and assay, 8,480 ozs. crude bullion.

Territorial Enterprise, July 15th: The Baldwin district lies on the western shore of Walker Lake and is well timbered and watered. Assays from the croppings of some of the prominent leads have yielded at the rate of $900 per ton in silver and gold.

The Cole Co. are still finding very fine ore in their mine in the place where they struck the rich streak a month or two since. In following the streak upward it has widened out till there is a body of pay ore eight ft. across. Assays made of this ore run from $40 to over $1,000 per ton.

July 17th: The new shaft of the Ophir Co. is now down 300 ft. The new shaft of the United States Co. is down 100 ft.

Work has been resumed upon the Bowers and Plato mine, Gold Hill.

The Petaluma mill, Lower Gold Hill, is now crushing about 60 tons of ore per day from the Kentuck mine.

The Imperial Co. are about to commence sinking a winze in the east drift, 700-ft. level, of their old works, to connect with the west drift from the Imperial-Empire shaft, 900-ft. level.

The Sierra Nevada Co. are building a large and substantial mill immediately adjoining their hoisting works.

Evans & Co. are building a new quartz mill on Cedar Ravine, a short distance below the Mariposa mill, and it is so near completed that it will start up to-morrow.

NEW MEXICO.

Santa Fe *Gazette*, July 4th: There are 1,000 miners at Elizabethtown. Nearly 400 men are employed on the great ditch, which will cost $115,000.

OREGON.

Jacksonville *Sentinel*, July 18th: The Occidental mill is crushing quartz from the Johnson & Elder lead. A clean up will be made some time next week. Everything looks flattering so far for a rich run.

Col. Drew commenced work on the Holman lead on Wednesday morning last. Four miners are employed in taking out quartz.

UTAH.

Reese River *Reveille*, July 16th: This morning a teamster brought into the city from a cañon about 40 miles from Salt Lake City, which he offered to sell at the low rate of 6½ cts. a pound. The coal is of the bituminous variety, and is excellent for the manufacture of gas.

WYOMING.

Sweetwater Mines, June 20th: Rock Creek as a gold-bearing creek, increases in reputation from day to day as work is pushed forward on the different claims. As high as 55 cts. to the pan has been taken out of some claims just above Atlantic City, this week by some companies opening their claims.

We yesterday paid a visit of inspection to the tunnel of the Hermit Mill and Mining Co. This company is composed of energetic, wide-awake gentlemen, who propose cutting the Cariso Hill in twain, thereby developing the numerous veins that intersect that locality. The work on the tunnel so far reflects great credit upon the superintendent, Mr. Vaughn. For the first 45 ft. the rock was exceedingly hard and slow progress was made, but from present indications we expect the work will be pushed forward rapidly. The tunneling operation of this company is one of the largest mining ventures yet started in the country and we have no doubt will well reward—as it should—the boldness of the originators.

The recent discoveries in Jones' Gulch have caused considerable excitement here and elsewhere. The gulch is about five miles southeast of Atlantic City, in California district, and the late developments there have encouraged the operators in the belief that they are in possession of diggings which will pay them $25 a day to the man. By the discoveries which are daily being made of both quartz and placers, we are insured in the belief that the country has not been thoroughly prospected yet, and we are confident that in the future discoveries will be made which will eclipse anything we now have, if possible.

June 24th: At Wind River are found warm springs, marble lodes, slate rock for house covering, tables, etc., oil springs, tar and many other natural productions.

We saw a prospect on Tuesday last taken from the Cariboo ledge, situated about one mile from Atlantic City, and which was, to say the least, extraordinarily rich; this ledge was discovered April 25th, 1868, by L. Pease, Esq.

Col. Tozer is rapidly driving forward the work on his quartz mill, and will have it in running order, crushing rock by the 15th of next month.

July 3d: The miners in Jones Gulch are getting very satisfactory results, and anticipate a rich harvest as soon as they get their ditch in from Rock Creek, which will furnish them an abundance of water for placer mining. No other country, that we have ever seen, in over nineteen years of mining experience, offers such inducements for energetic men with capital, as this one. There are innumerable dry gulches and sags that are known to prospect rich, which could have an abundance of water brought on to them at a slight expense, in comparison to what it has cost in older mining sections.

The owners of the Young America ledge have got out several tons of the valuable ore, and intend to have it crushed when Messrs. Tozer and Eddy complete their mill.

We visited the placer claims of Messrs. Wilson, Nichols, Haven & Co., on Tuesday last, and were gratified at the sight of some fine nuggets. One of them—the largest—worth about $120, was picked up by Mr. Wilson. These gentlemen labor under many difficulties in doing their work on account of the very limited supply of water, yet they have obtained nearly 200 ounces of ore.

Tozer & Eddy are taking very fine ore from the Cariso ledge. The Julian ledge is situated about one-half mile north of Atlantic City. It was discovered and located June 2d, 1868, and contains 1,200 ft., owned by Messrs. Sheenan, Davis, Clawson, Manson and Lane. The company have a shaft sunk to the ledge 15 ft. deep, disclosing a vein of excellent ore five ft. in width, showing free gold in numerous instances.

Workmen upon the Eastern Slope ledge have at last struck the vein at a depth of 10 ft., and are now taking out quartz of a good quality. The claim was located by R. Grace, Esq., and bids fair to be a valuable one. The claimants have been prosecuting the work with much vigor.

The James Dyer Co. are pushing forward the work of development on their fine property with commendable energy. They have let a contract for sinking their shaft, and expect to have several thousand dollars worth of ore on the surface ready for crushing, by the time Col. Tozer's mill is in operation.

The miners in California are doing remarkably well in working their different placer mines. We hear that some of them are making as high as $40 per diem. Scarcely any of them less than $10.

Cheyenne *Star*, July 4th: A. F. Spicer, an old Pioneer and Colorado miner, called at our office yesterday, and showed us a bottlefull of as nice gulch gold as we ever saw. He procured it 45 miles southwest from Fort Sanders, near the Colorado line, in a new mining district, organized under the name of Antona, upon a stream tributary to North Platte, named Antona river. This is quite a large stream, sufficient to furnish an abundance of water for mining purposes. It is a few miles south of Rock Creek. He also showed us some gold-bearing quartz from the same neighborhood, which looks very promising. We know, from having visited that section, that there are indications of rich gold and silver mines all through that country. Mr. Spicer had $75 worth of gold. In procuring it he made $7.50 per day, and was working with poor sluices and at great disadvantage. He is certain that it will pay $10 per day to the hand. He and his party have prospected several miles of this gulch, with about the same results as where they were working, and thinks the mines are extensive. There was another company operating just below him with still more favorable results.

The pearl fishery grounds recently discovered at Western Australia extends along the coast for 1,000 miles. Upwards of fifty tons of pearl oysters were fished up in December last, and sold for £100 per ton.

The tour of the world can be made in two months and a half, when the Pacific Railroad is finished.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent, July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

San Francisco:
Saturday Morning, July 25, 1868

Notices to Correspondents.

ALPHA.—It is not uncommon when employing the word element in its popular acceptation, to use it in the same sense in which it was applied by the ancients, viz.: as denoting fire, air, earth and water. All these have been shown, during the last century, to be compounds; and the term is now only used, scientifically, to denote bodies which, up to the present period, have resisted all efforts made to decompose them. The total number of what are now considered elements is about sixty-five. The well-known metals are among the most numerous, to which have to be added the gases,—hydrogen, oxygen, chlorine and nitrogen, carbon, silicon and boron, sulphur, phosphorus, etc.; the remainder, not enumerated above, are relatively unimportant so far as quantity is concerned.

ARCHÆOLOGIST.—Chemistry cannot be asserted to have had an existence prior to the sixteenth century. We find in the writings of the earlier chemists, many curious and important facts and discoveries, which remained useless and unapplied, so long as men's minds were exclusively employed with the transmutation of metals, the composition of an universal elixir, and the production of the *Alcahest* or general solvent. It is sometimes profitable and generally amusing to revert to these crude speculations and waking dreams of the writers on such subjects, who were eminent during the fourteenth and two successive centuries; but the time of a student will be more usefully occupied in garnering the labors of those who, discarding visionary hypotheses, proceed to the investigation of truth by the steady light obtainable from the sun of philosophy.

LITHOS.—Silica or silicic acid, may be obtained in a state of purity as follows: Heat to redness, in a platinum crucible, powdered rock crystal (quartz) with a quantity of carbonate of soda or potash; add to the solution a quantity of hydrochloric (muriatic) acid, and evaporate to dryness; a fine gritty powder will remain, which on being well washed with water, and subsequently ignited, will leave a residue of pure silica.

PROSPECTOR, Napa County.—Nickel and cobalt may be separated by adding cyanide of potassium to a solution of those metals; a precipitate of cyanide of nickel will thus be formed, which re-dissolves on adding an excess of the re-agent,—a double compound of cyanide of nickel and potassium being produced, which is soluble in water. The double cyanide is to be decomposed by dilute sulphuric acid, with precipitation of cyanide of nickel.

L. S., Hunter's Valley.—The variety of copper ore, allied with silver, to which you allude, both metals being associated with selenium, is denominated *Eukairite;* this term was employed in allusion to its discovery almost simultaneously with the conclusion of Berzelius' examination of selenium. The term is derived from a Greek word signifying *opportune.*

SMELTER, Gold Hill.—Proof-lead of the greatest purity may be obtained by the following method: Dissolve sugar (acetate) of lead, in a small quantity of hot water; filter, and then add plates of zinc to the solution until the metallic lead is wholly deposited. Dry the resulting lead between folds of blotting-paper, and preserve it in a well stoppered vial.

General Condition of the Mining Interest.

We have been much interested the past week in looking over some portions of Mr. Browne's final report, on the mineral resources of the Pacific Coast. From the data set forth in this document, it seems impossible to come to any other conclusion than that we are just entering upon the beginning of our grand success as a mining people. The following remarks of Mr. Browne are in accordance with the observations of nearly all who have taken a careful survey of our mineral prospects:

After many years of travel over the mining regions, I feel justified in asserting that our mineral resources are practically without limit. Explorations by competent parties during the past year, in many parts of the mineral regions hitherto unknown, demonstrate the fact that the area of the mineral deposit is much larger than was ever before supposed. It is safe to assume that of the claims already recorded in the settled parts of the country, and known to be valuable, not more than one in a hundred is being worked; and that of those worked, perhaps not more than one in fifty pays anything over expenses, owing to mismanagement, inefficient system of reducing ores, want of capital, cost of transportation, and other causes susceptible of remedy. In many districts of Nevada, silver ores of less value than $100 per ton cannot now be worked by mill process so as to pay expenses; and there are districts in Idaho and Montana where gold bearing ores will not justify working unless they yield from $20 to $50 per ton.

With such wealth of treasure lying dormant, it cannot be doubted that, by the increased facilities for transportation and access to the mines soon to be furnished by the Pacific Railroad and its proposed branches, and the experience in the treatment of ores, and the scientific knowledge to be acquired in a National School of Mines, adequate to the necessities of the mining population, the yield must eventually greatly increase.

So far as California is concerned, Mr. Browne admits that the gold yield is decreasing; but that decrease is due to the gradual exhaustion of the more easily accessible placer mines. This is a result which might reasonably have been expected. Placer mines, from their very nature, must be limited in their extent. Still it will be many years ere the present yield from that class of mines falls below the present average, as the most of the gold now obtained therefrom, is from the deep mines or hydraulic diggings, which are immense in extent and whose exhaustion must be the labor of more than one generation.

Our chief reliance is upon vein mining, the extent of which is practically illimitable. This description of mining was never so prosperous or so well understood as now; and it is, moreover, constantly improving, with the fairest prospect of continued increase for generations to come. True there have been many losses in this branch of mining industry, for it is a business offering unusual chances for folly and ignorance in its prosecution. Such results may in a great measure be ascribed to the reckless and adventurous spirit so characteristic of Americans, who take the lead in the development of the mines, and who, though energetic and generally intelligent, lack experience in this particular branch of industry, and are, moreover, prone to extravagance and reckless speculation.

Mr. Browne lays great stress upon these "blunders," as he calls them, and remarks that though they are being gradually corrected, yet they are still sufficiently common in California to detract nearly or quite one-half from what should be the yield of our mines, under a proper management. In describing these mistakes he says: "The greatest common blunder in quartz mining, and the most common error in early times, as well as in our own days, has been that of erecting a mill before the vein was well opened, and its capacity to yield a large supply of good rock established. The commission of this blunder is conclusive proof of the utter incompetency of its author to have charge of any important mining enterprise. If there were any possibility that it should in some cases lead to considerable profit, there might be an excuse for it; but there is none,—it never pays. All the chances, including that of utter failure, are against it."

This is the abyss into which many a once hopeful company has been plunged, not only in California, but in Nevada, Colorado and other localities as well.

The next "blunder" to which Mr. Browne refers, is the lack of discrimination "between a pocket vein and a charge vein. The existence of rich specimens was considered proof of the high value of a mine; whereas among experienced quartz miners, it excites their suspicions and distrust. Nine-tenths of the lodes which yield rich specimens do not pay for milling." This latter is an important fact which should be borne in mind by Eastern or outside purchasers or investers in mines.

The next error alluded to is that, until recently, nothing was known of "pay chimneys;" if good quartz was found in one place in a mine, it was presumed that the whole mine was of like character. It often occurred that their pay chimney was near the end of one claim, from which it dipped into another, leaving the first almost barren of pay rock. In some cases the miner did not know enough of mining to follow a chimney when he had it in his own claim.

A fourth error particularly referred to was that of sinking a shaft when there was no warrantable indication at the surface—a policy which may do in mining for the baser metals, but which is exceedingly risky in searching for gold or silver.

After alluding to a few other errors of minor importance, Mr. Browne appropriately sums up the whole matter in a very few words as follows: "The business will never be established upon a proper basis until the superintendents, as a class, are well educated chemists, mining and mechanical engineers, and mine owners frequent visitors, if not regular residents, at the mines."

SAN FRANCISCO GLASS WORKS BURNED. We regret to state that the San Francisco Glass Works, at the foot of Third street, in this city, was greatly damaged by fire on Thursday morning last. The building and tools, and a large amount of manufactured stock, was destroyed. We are happy to learn, however, that the furnaces and melting pots, both those in use and those in process of seasoning, were comparatively uninjured. The loss is about $10,000, on which there was an insurance for $5,500. This was the most important glass manufactory ever put in operation on this coast—and the only one where white glass has ever been successfully made. The works have been operated by Mr. C. Newman, who has spent a large amount of time and money in bringing it into successful operation. We understand that the works will be rebuilt immediately.

RICH SPECIMENS.—A fine lot of very rich specimens was recently received by Mr. J. W. Moyle, of this city, from the Oriental G. & S. M. Co's mine, (late the Union mine) located in Wet Ravine, Forest Township, Sierra County. A portion of these specimens were sold to be worked up into quartz jewelry; a large specimen may be seen in the show-window of William E. Goldsmith, 505 Montgomery street. Thirty-three pounds of the poorer portions of the specimens were crushed, and yielded sixty ounces of gold, assaying $1,053. Mr. J. W. Moyle, of this city, is President of the company, which has recently been incorporated.

MESSRS. TALBOT, GAWLEY & JOHNSON, auctioneers in this city, have received the appointment for selling the tide lands at auction, under the State authorities. This is a new firm, who have thus received a high compliment and an important trust.

The Mariposa Estate.

We were somewhat in error, last week, in our statement in regard to the present proprietorship of the Mariposa Estate. Our cotemporary, who attempted to correct us, was also at fault, as will appear by comparing the remarks in the *Alta* of Monday last with the following, which we obtain from the final report of the Committee, appointed by all parties interested, to devise some plan for funding the liabilities of the company, etc.

In order to more fully understand the action of this committee, we will premise that on the 12th of November, 1858, a judgment was rendered against John C. Fremont, in favor of O'Campo, and a Sheriff's deed in due time given to parties purchasing under said judgment, but who subsequently transferred said deed to C. K. Garrison. Subsequently Garrison brought suit of ejectment against the company, and a compromise was finally effected, by which the company agreed to pay $320,000 (gold)—$120,000 of which was paid down, and a deed was given by Garrison to the company, to be held as an *escrow*, to take effect on the 22d of June last, if the balance of $200,000, with interest, as specified in the contract given at same date, was paid. If said balance was not paid, the company was to forfeit the amount already advanced.

One-eighth of this title had previously been deeded to Selover, and by him to the company—so that this eighth interest and the right to redeem was all that the Mariposa company owned in the Estate.

Mr. J. W. Brumagim, of this city, subsequently became the purchaser of this Garrison title to seven-eighths of the property.

The time for the settlement of this claim would have expired on the 22d of June, as stated in the *Alta;* but previous to that time, a committee of bondholders, already referred to, having been appointed and authorized to confer with Mr. J. W. Brumagim or his agent in New York and with the officers of the Mariposa Company, with the view of devising some plan for funding all the liabilities of the Estate and raising means to secure to the company this outstanding seven-eighths interest, had attended to that duty and matured a plan, which was formally accepted by the parties interested on the 4th of June last.

Under this plan of settlement, Mr. J. W. Brumagim's interest has been vested in a board of three Trustees, who will issue certificates to represent the entire indebtedness of the company. This Board consists of Messrs. Mark Brumagim and John A. Stewart, of New York, and Mr. John J. McEwen, of this city. These gentlemen have already taken possession of the Estate, and entered upon the discharge of their duties.

In consummating this arrangement, the claim of Mr. John W. Brumagim has been fixed at $300,000, the one-half of which is to be paid in cash from the first proceeds of the sales of the certificates, and to bear ten per cent. interest until paid. The other half is to be paid out of the first profits from the working of the mine, and is also to draw ten per cent. interest until paid.

After this claim has been paid off, the further profits of the mine, over and above necessary improvements, are to be applied to the payment of dividends on the certificates to be issued as above. Whenever the several claims against the company have been paid off, and the debts of the Mariposa Company so reduced as not to exceed $100,000, the Trustees are required to reconvey the property to the company. But if the Estate should fail to pay either the claim of Mr. Brumagim or the other indebtedness within the time specified in said deed of trust, provisions are made for a final closing out of the interest of the Mariposa Company in the property—the same to be sold for the benefit of the creditors, who are to receive the proceeds in the order or proportion of their several claims.

The certificates, as above, will be issued

only to the bondholders or other creditors of the Mariposa Company, or to the holders of preferred stock, in exchange for and upon the surrender to the Trustees of the bonds or other obligations of the company. The trust deed contains carefully prepared provisions as to the mode of issue and transfer of said certificates, payments of dividends thereon, etc. The certificates were ready for delivery in New York on the 5th of last month (June), at the company's office, 34 Wall street.

It is a matter of congratulation that the various conflicting views and interests of the several parties interested in this property have finally been arranged and harmonized. This matter has been brought about, in a great degree, through the efforts of Mark Brumagim, Esq., of New York, a brother of John W. Brumagim, of this city. That gentleman has, until recently, held the office of President of the Mariposa Company, and during his connection with this company to the present time, has ever enjoyed the unlimited confidence of stockholders, bondholders, and all other parties holding interest therein, either friendly or advorse to each other. As the chairman of the recently created Board of Trustees, it is his determination to revive the company, and, if possible, place it upon a substantial footing, to the end that it may start out on a career of prosperity and usefulness.

This property has heretofore been a very unfortunate one for most of the parties who have become interested in it, as well as for the county in which it is located, the business of which has often been thrown into confusion by the stoppage of work upon the Estate. It is peculiarly unfortunate, just at this time, that the company should suffer the loss of the destruction of one of their mills by fire (the Bear Valley Mill), as mentioned in our last issue; but we understand that it is the intention of the Trustees to allow no unnecessary delay in the reconstruction of the same. The new "Eureka Process," which has recently been introduced into that mill (the Lundgren pulverizers and Ryerson amalgamators), has already proved a most effective one, and fully settled the fact that rock can be obtained there which needs only a proper mode of reduction to return a large profit over working expenses and interest of investment. We sincerely hope that a new career of prosperity is in store for this valuable and extensive property, and that the time is not far off when the bondholders will begin to receive dividends on their investment.

We also understand that new mills are to be forthwith erected on the Merced, where an ample water power exists, and where unlimited quantities of good rock can be easily obtained from the Josephine and Pine Tree veins, and run directly upon inclines from the mines to the mills. The same process will be employed at their new works which has proven so satisfactory at the Bear Valley mill. The machinery is already on the ground, ready to be put in place as soon as the necessary preparations can be made. There is sufficient water power here to run 200 stamps.

Mexico still appears to be suffering from chronic discontent.

HENDY'S

LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in operation at the Union Iron Works, corner of Mission and First streets. This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Over 200 machines in successful operation in this State.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

First—In setting up, set the pan, A, level by the inner rim, near its center.

Second—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]

Third—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.

Fourth—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (8 Concentrators).....Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....Humboldt County, Nevada.
ROBINSON & McALLISTER M & M. CO. (3 Concentrators) Hunter's Valley, Mariposa County.
MIDAS MILL CO. (4 Concentrators).....Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....Owyhee District, Idaho.
GUADALUPE & SACRAMENTO G. & S. M. CO.....Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....Sonora, Mexico.
B. F. BROWN (1 Concentrator).....Melbourne, Australia.
JAMES HENTY & CO. (1 Concentrator).....Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

San Francisco, October 10th, 1867.

J. Hendy, Esq.—*Dear Sir:*—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

North Star Mine, Grass Valley, Feb. 26, 1868.

J. Hendy, Esq—*Dear Sir:*— In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets.

Respectfully, etc. W. H. RODDA, Supt.

An Additional call for Hendy's Concentrators

Has just been complied with, and the machines shipped to Grass Valley, Nevada Co., Cal., viz: One machine for the Empire Company, and two for the North Star. Hendy's Concentrators have been in constant use in these mills for more than eight months, and these orders completed a set of ten machines for each mill. The North Star Company have just added eight new stamps to their machinery.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Chaine Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

GODDARD & CO.

San Francisco, May 1, 1868. 18v16tf

Phœnix Iron Works.

JONATHAN KITTREDGE, Proprietor,

Nos. 18 and 20 Fremont street, near Market,

MANUFACTURER OF

Fire-Proof Doors, Shutters,

Wrought Iron Girders, and all kinds of Housesmith work, Bridge and Prison Work;

BANK VAULTS AND MONITOR SAFES,

FORGING AND MACHINE WORK.

Agent for the ISHAM KEY REGISTER BANK AND SAFE LOCK, the only first class Lock in the United States. 1v17tf

THOMPSON BROTHERS,

EUREKA FOUNDRY,

Two of the above steamers leave BROADWAY WHARF at 4 o'clock P. M. EVERY DAY (Sundays excepted), one for Sacramento and one for Stockton, those for Sacramento connecting with light-draft steamers for Marysville, Colusa, Chico, and Red Bluff.

Office of the Company, northeast corner of Front and Jackson streets.

B. M. HARTSHORNE,
13v12 **President.**

To Inventors.

The undersigned is now prepared to assist inventors or others by manufacturing Models for the Patent Office, large working Machines or Devices of every description, in Metal or Wood, in the most workmanlike manner and at reasonable rates. Also, Patterns for Iron and Brass Work and all kinds of Machinery.

Having had ten years practical experience in this city, parties can be assured all work entrusted to me will be executed in a prompt and satisfactory manner. Power will be granted to parties wishing to test or experiment with machinery.

☞Full files of the Patent Office Reports for the use of patrons. **J. H. CULVER,**

3v17-3m **20** Fremont street, over Phœnix Iron Works.

The Use of Powder in Placer Mining.

In the Smartsville Blue Gravel claim, at Sucker Flat, in Yuba county, powder is used more extensively than in any other hydraulic claim, indeed, probably more than in any other mine in California. All the strata are too hard to be piped down with economy, and some of them are so hard in places that the pipe would scarcely effect them. So much powder has been used here that its employment is reduced to a system. The quantity of powder for the blast depends upon the depth of the bank and the surface area to be loosened. If the bank is 50 feet deep a tunnel 4½ feet high and 2½ wide may be run in 75 feet; a cross-drift 60 feet long is cut across the end at right angles, and another similiar cross-drift of equal length 55 feet from the mouth of the tunnel. Three hundred kegs may be used in such a blast, all distributed along in the cross-drifts and in the tunnel beyond the first cross-drift. Twenty kegs near the intersection are opened by taking out the heads; the others are left closed, with the certainty that they will all be opened by the explosion of the 20. From the intersection to within 10 feet of the mouth wooden troughs two inches wide and deep inside are laid, and a liberal supply of powder is poured in, leading to an open keg. The 10 feet next the mouth are laid carefully with a fuse, and for that distance the tunnel is filled in with dirt. When the blast is fired a dull, heavy sound is heard, the ground rising slowly about 10 feet; it then settles down, leaving a dust behind it, and on examination an area about 120 feet square will be found all shattered.

By blasting, the water is enabled to carry off twice as much dirt as otherwise; and as 500 inches of water are used at an expense of $75 per day, there is a vast saving. The cost of powder is large, as about 10,000 pounds are consumed monthly on an average in this one claim. After the ground has been blown the pipes can bring down more than they can carry away, so about one-third of the water is allowed to run down over the bank, while the remainder is thrown through the pipes.—*Ross Browne's Report.*

WHO SHOULD COME TO THE CITY—WHO GO AWAY.—Horace Greeley says: "There is a class of country-bred persons who can, sometimes, do well in a great city, almost from the day they enter it. This is the class of thoroughly capable, energetic, temperate, thrifty mechanics, who have not yet married. Any one of these may drop into the city, in March or April, of any prosperous year, when work abounds and everything is thriving, and find employment at good wages, of which he may save half, if he will. True, his expenses will overtake his income if he stays here until surrounded by a swarm of children; but why *should* he stay here so long? If he develop qualities which insure him a leading position and a liberal income, he can well afford to stay; if not, let him be off in season to have his children country-born. To rear sons and daughters in narrow, crowded city quarters, on the stinted allowance of a mere journeyman or laboror, is not to treat them fairly. Give them air to breathe, hills to roam over, and woods to frequent, so that they shall grow up in health and vigor. The city is hard enough on the poor man; it is entirely *too* hard on the poor man's children."

ESTIMATION OF THE QUALITY OF SOAP. The quality of soap may be properly estimated from the amount of fatty acids which any given specimen contains. The following simple analysis may be performed by any one, and may be relied upon as giving good results:

The soap to be examined should be dissolved in water. If distilled water cannot be readily obtained, rain water will answer well enough. When a perfect solution is obtained, add hydrochloric acid. After a little while the fatty acids will be found to be separated from the other constituents of the soap. These should be collected, and their relative weight for any given quantity estimated. The relative weight thus found will be a sufficiently just indication of the quality of the soap.

VERY PROPER.—Hon. Henry Wilson has reported an appropriate joint resolution that all officers or privates who served in the armies of the Union during the war should on occasions of state and ceremony, wear the badge of their corps or division. Nothing could be more proper than to revive on all proper occasions the honorable and glorious associations connected with the War for the Union.

BRIDGE AT ST. LOUIS OF FIVE HUNDRED FEET SPAN.—J. B. Eads, a prominent civil engineer, recently wrote a lengthy report to demonstrate the practicability of building a bridge over the Mississippi River at St. Louis, with spans of 500 feet. He argues that it is possible to throw an arch of cast steel, 2,000 feet long, across that river. If we are not mistaken, the largest bridge-span ever constructed is the main truss span in the Knilinbnrg bridge, in Holland, which is 515 feet long, and sustains a double railway track.

We notice by the telegraphic dispatches of Tuesday of last week, that a bill passed the Senate at Washington the day previous, "authorizing the construction of a bridge, with 500 feet span, over the Mississippi at St. Louis"; from which we infer that the recommendation of the engineer, Eads, has been favorably considered by the company in whose interest he is engaged.

THE NEW YORK UNDERGROUND RAILWAY Co. has been chartered with a capital of $10,000,000; the company to deposit $300,000 by Jan. 1st, 1869, which sum will be forfeited to the sinking fund of the city, if the tunnel and track is not completed within five years. The track is to be laid as near as possible between the main carriage ways connecting the northern and southern portions of Manhattan Island. It will commence at a designated point in the City Hall Park. The tolls cannot exceed six cents for passengers for a distance of six miles, and for any mile addition or fraction thereof—two cents. It may safely be predicted that the New York underground railroad will soon be a reality. Of its convenience and value to the city there can be no doubt; nor of its ultimate value in a pecuniary light.

CHEAP TRAVELING.—The fare from New York to Boston, by boat and rail, which was formerly as high as $10, has recently been reduced by opposition to $1.

Mechanical Drawings.
Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office

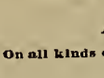
A Mountain Railroad in Colorado.

At Denver a tram-road is projected into mountains of South Park, etc., as a means for transporting lumber, shingles, lath, cord wood, building rock, lime, charcoal, stone coal, timbers, posts, poles, and, in fact, all kinds of building material at one-half the prices heretofore paid for the same during the most favorable seasons for transportation. When this road is built, citizens expect to pay no more $80 per cord for fire wood ; $40 per ton for coal, $75 per M. for lumber. But, on the other hand, the company can afford to transport wood for $4 per cord; lumber for $8 per M. ; stone coal, lime and building rock, each, for $4 per ton ; and all other materials in proportion. It is reckoned that the saving to the Denver Pacific Railway, alone, in the item of ties and timber, would pay all costs of building and operating the tram-road.

The plan of construction is as follows : The ties are designed to be seven feet long, round timber ; the rail 8x8 inch, sawed spruce timber 16½ feet long, let into the ties and securely keyed ; track, four feet wide ; car trucks 8 or 10 feet long ; wheels, 18 inches in diameter, 4-inch tread, with square flange ; capacity, from 6,000 to 7,000 pounds. These rails can be turned and used four times, or can be strapped with iron when desired by the company.

The greatest coal regions of Pennsylvania some years ago, before large and expensive railroads could be built, were traversed by the same kind of railroads ; with the only difference, that they used mules and horses for motive power, while this company proposes to use small, but powerful locomotives.

There are many localities in California and Nevada where roads might be constructed on the above or some similar plan, which would save thousands of dollars to the citizens of the different localities in the matter of transportation of both passengers and merchandise. We have often called attention to this plan of cheap, narrow gauge roads, upon which either light locomotives or horses could be used. The idea that a railroad *must* be built to sustain the weight of 25 or 35-ton locomotives is all moonshine. No such necessity exists, except in localities where the press of business demands it. In fact railroad managers, everywhere, are beginning to find out that the engines generally employed for ordinary railroad traffic are quite too heavy. Lighter equipments, lighter rails and lighter trains than are now employed, will eventually come into use. California is even now acting upon this idea. The engines generally in use here are lighter than those employed in the Eastern States for the same class of business.



The Hoosac Tunnel.—Much opposition has been brought to bear against any further expenditure by the State of Massachusetts on the Hoosac tunnel; but the late Legislature has finally placed its completion beyond the possibility of any farther interference, by authorizing a contract with any responsible party who will complete it in seven years, and making an appropriation of $5,000,000 therefor. It will soon be placed under contract. Something like $3,000,000 have already been expended in this work, which, however, includes forty-four miles of railway, renting for $55,000, which will be opened this summer. A Boston paper of recent date says that for the three months ending May 30th, 1868, the several sections of the Hoosac Tunnel have advanced 759 feet, or at the rate of 3,036 feet per year. At this rate of progress the tunnel will be opened in about five years and a half, as but two-thirds of the original length, or 16,800 feet, remains to be perforated. It is said that the present style of drill, which was described and illustrated in the Mining and Scientific Press, April 4th, 1868, has more than doubled the rate of progress in this tunnel. The latter fact is especially worthy of notice by those engaged in extensive mining operations in this State.

Santa Cruz Lime.—The *Sentinel* says that Davis & Cowell are burning and shipping an average of 1,000 barrels of lime er week.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866 :
I. Applicants' Declaratory Statement.
II. Diagram, Description of Diagram and Boundaries, and Notice.
III. Register's Order for Publication—with Notice.
IV. Deposition that Notice has been Posted.
V. Application for Survey Etc.
Prices.—Single blanks, 10 cents ; 75 cts per dozen ; $4 per hundred—postage paid.
Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

Postmasters are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

The Mining and Scientific Press has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

Mechanics' Institute Fair.

CLASSIFICATION OF GOODS.

The goods and manufactures to be exhibited are divided into thirty classes, which are as follows:

CLASS 1. *Steam Engines* — Comprising stationary, marine and fire engines and locomotives; also, boilers and improvements thereon. *Motive Powers*—Comprising air engines, electric engines, and all motive powers, such as turbines, water wheels, windmills, etc.

CLASS 2. *Manufacturing Machinery* — Comprising machinery used in working metals, machinery for working wood, as sawmills, planing machines, mortising machines, scroll saws, lathes, etc.; agricultural machinery and implements.

CLASS. 3. *Mining Machinery*—Comprising machinery used for mining, tunneling and metallurgical processes, crushers, stamps, grinders, and other pulverizing machines, amalgamators, concentrators, pumps, hose pipes, nozzles, couplings, etc.; furnaces for roasting ores, apparatus for burning petroleum, as steam fuel, etc.

CLASS 4. *Naval Architecture*—Comprising ships of war and commerce (models) boats, barges, and vessels for amusements; tackle, rigging and general improvements, including all kinds of metallic and hemp cordage.

CLASS 5. *Military Engineering*—Comprising military engineering, armor accoutrements and ordnances, small fire arms, tents and camp equipages, etc.; gunpowder and other explosive compounds, matches and fireworks.

CLASS 30. *Miscellaneous.*

RAILROADS OVER RIVERS.—John A. Roebling, the well known engineer, says that instead of draw bridges for crossing our western rivers, as is demanded by railroad men, the public should insist upon treating railroad bridges, where a large river traffic exists, as inclined planes, with a stationary engine and wire rope to help the trains over. The idea appears to be a good one.

RAPID PROPAGATION OF CEREALS.—In three years a farmer iu the Isle of Man raised seven bushels of barley from a single grain.

MANAGERS OF THE FAIR.—The list of Officers above enumerated constitute the Board of Managers of the Sixth Industrial Fair of 1868.

INCREASE OF POPULATION.—San Francisco, at the present time, is increasing in population at an almost unprecedented rate, owing msinly to the radical change in ocean transit rates, and the favorable ideas which have been formed abroad, of the resources of this State, by reason of the rapid increase in the value of our export prodnctions, other than bullion. The port statistics for the six months onding June 30th, show a net increase to our population of 20,819 against an increase of only 8,000 for the correspouding period of last year. Fully one-half of that number may be set down as a permsnent increase to the population of this city.

New Mining Advertisements.

Gold Hill Tunneling Gold and Silver Mining Company.—Location: Gold Hill Mining District, County of Storey, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of July, 1868, an assessment (No. 10) of two dollars per share was levied upon the capital stock of said Company, pay able immediately, in United States gold coin, to the Secretary, R. Wegener, 414 California street, San Francisco, Cal., or to the Superintendent, H. Huguet, Gold Hill, Nevada.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of August, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the ninth day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. WEGENER, Secretary.

Office, 414 California street, San Francisco. jy25

Mining Notices--Continued.

Apollo Gold and Silver Mining Company, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the fifteenth day of June, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the twentieth day of May, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on the sixteenth day of July, 1868, at the hour of 12 o'clock A. M. of said day, for cash, in U. S. gold coin, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

PAUL NEUMANN, Secretary.

Office, No. 411 California street. jy1

POSTPONEMENT.—The above sale is hereby postponed until Friday, the thirty-first day of July, 1868, at the same hour and place. By order of the Board of Trustees.

PAUL NEUMANN, Secretary.

San Francisco, July 14, 1868. jy18

Bear River Mining Company, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of June, 1868, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of July, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the third (3d) day of August, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINOTON, Secretary.

Office, Room 37 New Merchants' Exchange, California street, San Francisco. jc13

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until the twenty ninth day of July 1868, and the sale thereof until Monday, the seventeenth day of August, 1868. By order of the Board of Trustees.

jy18 J. M. BUFFINGTON, Secretary.

Chipioneta Mining Company—District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of July, 1868, an assessment of five ($5) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirteenth day of August, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirty-first day of August, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, up-stairs, San Francisco. jy11

Eclipse Gold and Silver Mining Company, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the fifteenth (15th) day of June, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the ninth (9th) day of June, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Wednesday, the fifth day of August, 1868, at the hour of 12 o'clock, noon, of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

DAVID WILDER, Secretary.

Office, No. 533 Kearny street, corner of Sacramento street, San Francisco, Cal. Office hours from 12 to 2 P. M. jy18

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration which they may desire made in their advertisements at their earliest convenience. New advertisements should be handed in as early as possible.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so consantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Mission st., San Francisco.

Hunt's Patent Wind-Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells,—including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump.

Pumping Machines and general Machinery kept constantly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

23v16 **E. O. HUNT, Proprietor.**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour.....$50

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Farther particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

With a Chapter on the

BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.--Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for [illegible] mining advertising.

Rules to Discover the Lost Part of a Shifted Vein.

The following "rules" may often be found of much benefit in the early stages of many mining operations:

Faults or shifts often occur where two veins traverse each other. The one which keeps its direction at the point of crossing (strike) must be the newer or younger, as fills a fissure in the other. When such a dislocation is met with in drifting or sinking on a lode, it is of the greatest importance to know on which side, or whether above or below, the shifted part of the main vein has to be sought.

The following four rules were given by J. C. L. Schmidt, and are here translated from his work:

"1st. If vertical veins are severed by other veins, the former are not shifted, but continue their course in the same line with the latter. (This is called a "tourn-house" by the miners.

2d. If slanting veins, dipping at an angle less than ninety degrees, are bisected by vertical veins, the former are shifted.

3d. If slanting veins bisect vertical veins, the latter are shifted.

4th. When veins meet at a right angle, no shift is produced in the older vein.

The rules which Mr. Schmidt gives for the discovery of the lost parts of shifted veins are as follows:

1st. If the newer vein dips in a contrary direction to the older one, the lost portion of the latter must be sought on the side where an acute angle is formed by the bisection of the two.

2d. If the two veins dip in the same direction, and the newer vein is more horizontal than the older one, the lost portion of the latter will also be found on the side of the acute angle.

3d. If both veins dip in the same direction, but the newer or younger vein is the most vertical of the two, then the lost part of the shifted vein is to be sought on the side of the obtuse angle.

The latter case being the most common of all, it has previously been the generally admitted rule always to seek the lost portion of a vein on the side of the obtuse angle formed by the vein that is thrown off, and the cross course.

One universal rule is laid down by Mr. Zimmerman, that is applicable to all cases. This gentlemen has had a lifetime's experience in vein-geology, and his results may be considered reliable. The following is his rule:

"Erect a perpendicular line at the point where the cross-course has been struck, upon its line of strike, but towards the interior of the vein. Determine the position of the line of bisection of both veins, which passes the point where the cross-course was struck; prolong this sufficiently towards the opposite selvage; noticing the direction toward which the perpendicular (in approaching the opposite selvage) diverges from the line of bisection, and then seek the lost portion of the vein towards which the perpendicular diverges, after first penetrating through the cross-course."

The above was written for Mr. Lieber's report of South Carolina, several years ago, where also a diagram is annexed; the same one as furnished by Mr. Zimmerman. By this diagram the rule is made more intelligible.—*Colorado Miner.*

PISCATORIAL LOCOMOTION.—M. Monoyer, has recently completed some investigations upon the locomotion of fishes, which are of extreme interest to naturalists and physiologists. The movements of fishes through the water takes place, he says, by the action of the tail, and principally by that of the caudal fin. When the progression is rapid, the other fins play no part in locomotion. When the fish wishes to stop, it does so as an oarsman would by producing "back-water," which it effects through its pectoral fins. The other fins may be employed in this latter operation, but their only use is to prevent the fish turning round on its transverse axis.

THE engineer of a morning train from New York, on the New York and New Haven Railroad, recently discovered an iron rail across the track. He did not observe it in time to stop the train, but it was in such a position that as the cow-catcher struck it the rail broke in two pieces, throwing one piece with such force against a telegraph pole as to cut the pole in two, and the other under the engine, doing some damage, but nothing serious.

THE LARGEST ORGAN.—The new organ just placed in Alexandria Music Hall, London, is the largest organ in the world. It is much larger than the one about which Bostonians blow.

THE SIEMENS' FURNACE.—An English journal says Mr. C. W. Siemens' regenerative gas furnaces, and also his more recently invented process for producing steel direct from pig-metal, are now being applied in France, on a most extensive scale. There will soon be put in operation, in all, 284 producers, in four different establishments of 40, 112, 48, and 84 producers each, at the respective works. Each producer converts into gas two tons of fuel every 24 hours, so that the total consumption will be nearly 680 tons per day. The work which will be done by this consumption it would require 1,000 tons per day to accomplish under the present system, so that there will be a saving of 400 tons of fuel per day effected by the use of the gas furnaces, besides an important saving in the iron itself. Careful and often repeated experiments have proved that, where the Siemens' furnace is used, the wasting of the iron, during both the process of puddling and that of heating, is reduced fully three per cent., and in the case of the works of which we are speaking, the total saving thus effected will amount to about 70 tons of iron per day. Most of the furnaces put down will be of large dimensions, some of the heating furnaces being capable of turning out 40 tons of iron ingots per day. The producers will also supply gas for heating 60 double-flued Cornish boilers, some of which are now being made in this country.

GENERATING STEAM BY GAS.—Illuminating gas has been employed in England, in heating steam boilers and generating steam for working the hoisting apparatus of warehouses, or other purposes where steam power is only required at intervals of time. With a vertical tubular boiler of three horse power, steam at sixty pounds pressure is generated by twenty-three burners, consuming 100 feet per horse power per hour in full work. The compactness, economy, and efficiency of the gas-heated boilers is highly recommended by those who have used them. The first cost and expenses of maintenance is small, and the insurance companies have decided to require no heavy risk premiums on buildings furnished with boilers heated by this plan.—*Exchange.*

PROFITS OF MACHINE AND ENGINE BUILDING.—It appears that the building of engines and machinery offer as good a field as any other for the acquisition of riches. We find it stated in an exchange that the income of Wm. Mason, of Taunton, Mass., as returned to the United States assessor, amounts to the sum of $800,000 for the past four years, a larger aggregate than that returned by any other man in Massachusetts in the same time.

CARTRIDGES FOR BRAZIL AND RUSSIA.—The Metallic Cartridge Company, of East Bridgeport, Conn., have a contract from the government of Brazil for 6,000,000 cartridges, and are about to manufacture 7,500,000 for the Russian Government. The daily product of the works at present is 150,000 to 170,000 cartridges.

AN EXPENSIVE PURCHASE.—The famous ram Dunderberg, built for the United States government by William H. Webb, of New York, and sold to France for $1,500,000, has been completely overhauled and rebuilt by her new owners, at a cost of not less than $4,000,000, and is not yet satisfactory.

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

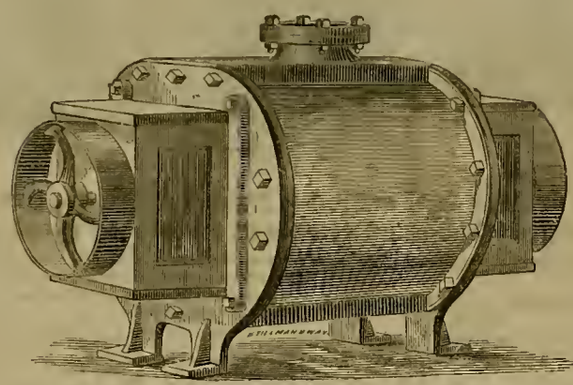
THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

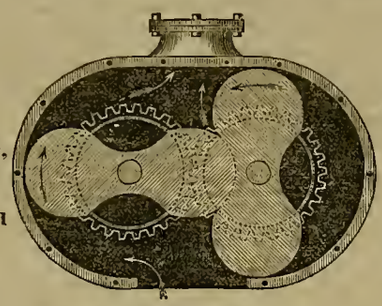
N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address



J. F. BUERK, Proprietor,
47 Congress street, Boston.

P. O Box, No. 1057. 23v16-6m



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

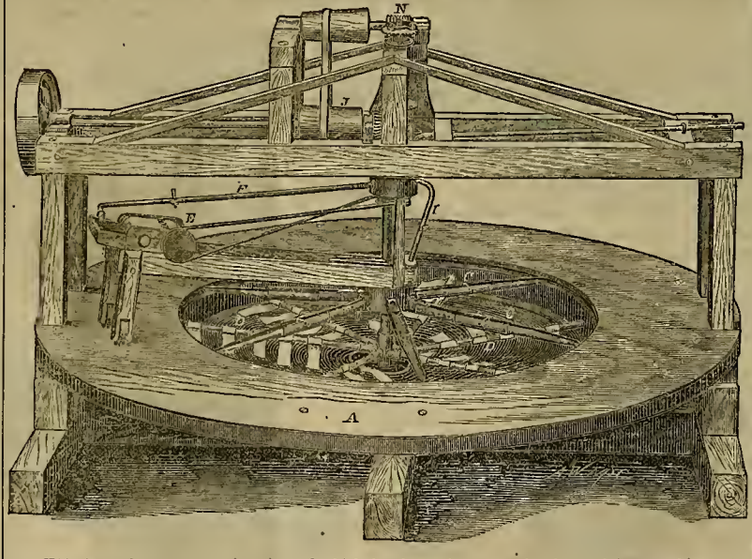
ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address



KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'

IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3 P.M. ☞Written communications preferred.

Important to Gold and Silver Miners and Companies.

PROFESSOR WURTZ,

Who is the inventor and Patentee of the new and wonderful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of

SODIUM AMALGAM.

All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc., Prof. W. has in operation in New York a large and small Hepburn Pan, for working 1,000 or 20-lb. charges of material for experimental purposes. 3v17

G. W. STRONG,

ASSAYER AND WORKER OF ORES,

UNION FOUNDRY,

Corner First and Mission streets, San Francisco.

Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.

14v16qr.

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pads, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

A New Treatise on Concentration of All Kinds of Ores.

INCLUDING THE CHLORINATION PROCESS FOR Gold-Bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally, by GUIDO KUSTEL, M. E. & M., author of Nevada and California Processes of Silver and Gold Extraction—120 lithographic dingrams.

OPINIONS OF THE PRESS.

KUSTEL'S NEW WORK.—Mr. Guido Kustel has just put forth another volume, a copy of which we have received from the publishers, Dewey & Co., San Francisco. The book contains 120 diagrams on seven plates. In issuing the work, the design of the author appears to have been to exhibit the present state of the art of concentrating ores as practiced in the older and more experienced mining sections of the world, as well as in the more recent mining operations in California. The principles on which the system of concentration is founded are stated without entering into scientific reasons.

The dressing of ores is treated at great length, and the plan is based on these principles: "1st. Each constituent of the mass of ore must be brought to the highest value which can advantageously be given to it. 2d. The useful minerals must be concentrated only to the most advantageous degree of purity; and, 3d. All loss of the quantity and value of the useful mineral must be avoided as far as practicable." Reduction in its diversified modes—by rock-breakers, stamps, rolling mills, and grinding in arastras, pulverizers, Chili mills and pans—necessarily occupies large space by reason of its importance.

The plan of reducing ores by stamps, in either the wet or dry process, forms a complete treatise of itself, and may be studied with advantage by all persons connected with reduction works of that character. Concentration of gold ores is specially treated in section 49, and of silver ores in section 50. The latter subject should possess interest for our millmen and miners, as the plan of concentrating ores is certain to be resorted to as soon as the business is understood and reduced to a system.

The sections of the work devoted to the extraction of gold from sulphurets, arseniurets, or quartz, by chlorination, are based on Plattner's process of the property of chlorine gas to transform metallic gold into soluble chloride of gold. By this process it has been demonstrated that gold is extracted perfectly. Our author says the process was first introduced into Nevada, California, in 1858, where there are several establishments in successful operation.

The process of chlorination is described in the fullest manner, and embraces a particular description of the various roasting furnaces in use, as well as of the operation of roasting.

We commend Mr. Kustel's treatise to the attention of all concerned in the business of mining and reducing ores, to whom it must prove a valuable hand-book of practical knowledge.—*Daily Reese River Reveille, Jan.*, 1868.

Price of the work, $7.50. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS, San Francisco, who will supply orders, by mail or express, at wholesale or retail.

HOW OFTEN do you hear the complaint from mother and father that their son or daughter is not well; that they have no appetite; that they feel languid; that their head aches; that they are growing thin and feeble, and that they have no life or energy left. That they are low-spirited, and perfectly incapacitated to participate in any pleasures, or perform any mental or physical duty. And the question is often asked, what shall I do for them? or, what shall I give them? Our answer is, let them try PLANTATION BITTERS moderately three times a day, and our word for it they will recover. *

MINING PRESS.—This old standard mining journal of the Pacific Coast, comes to us this week, number 1 of Volume XVII, and much improved in several particulars. A beautiful new head and heading letters throughout, make it the neatest, as it has always been the best, exponent of the industries of this coast. Every miner should take the PRESS. The subscription price is $5 per year, and the Postmaster at Monitor is an authorized agent.—*Alpine Miner July 4th.*

Mechanics' Fair Press.

Printed daily in the Pavilion--Circulated Free to over One Hundred Thousand (100,000) Industrial People.

Having received permission from the Mechanics' Institute, we shall print the

Third Volume of the Fair Daily Press,

in the Grand Pavilion, during the approaching Exhibition, which opens on the 8th day of August, 1868.

Our publication of the DAILY PRESS, in the Pavilion in 1864 and 1865, met with marked success, rendering ample satisfaction to its patrons and numerous visitors attending the Fairs. We are now confident that, with improved facilities, experience, and active efforts, the present volume will be made still more attractive and useful for the increased thousands who will visit the Exhibition, and receive, gratitously, each issue

Fresh from the Press.

Some ONE HUNDRED THOUSAND (100,000!) industrial people will visit the Fair and receive copies of the FAIR PRESS. This is a greater number of DIFFERENT INDIVIDUALS than the combined subscriptions of any other ten papers published on the Pacific Coast. Being a NEW PAPER (which the receiver has *seen printed*) the sheet will be preserved, and its contents—both reading and advertising—appearing entirely original, will secure its thorough perusal.

New and interesting features will be adopted. Each number will contain a large amount of sprightly local matter, together with much permanently valuable reading.

Hundreds of extra copies of the PRESS will be circulated throughout the country, by parties who have their inventions and business illustrated and described in our columns.

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive forms; we will otherwise assist advertisers in getting up their notices, when desired.

A limited portion of the paper will be allotted to a choice class of advertising, furnishing a favorable opportunity such as is rarely met with. Following are our uniform

Rates of Advertising:

One column during the Fair.....	$260 00
One-half column during the Fair.....	130 00
Per line (space of small type) during Fair,	2 00
Per line, 10 lines or more, during Fair...	1 75
Per line, 30 lines or more, during Fair...	1 50
Per line for single insertion.....	25

Notices of the Press:

Following are a few of the many compliments paid the previous volumes of the DAILY FAIR PRESS:

THE SCIENTIFIC PRESS proprietors strike off and give away thousands of their little sheet, entitled THE MECHANICS' FAIR DAILY PRESS. There were great crowds all the evening about the telegraph and the presses, many of whom had their first sight at the practical working of these great motors of civilization.—*S. F. Evening Bulletin, Sept.* 7, 1864.

SCIENTIFIC PRESS.—A printing office has been established at the Mechanics' Fair, and Messrs. DEWEY & Co., the enterprising publishers of the MINING AND SCIENTIFIC PRESS, are issuing from it a handsome double-sheet daily, which is a credit to themselves, its editors, and to the Fair.—*S. F. Morning Call, Sept.* 8, 1864.

Parties who intend to advertise will do well to subscribe at once for the amount of space wanted.

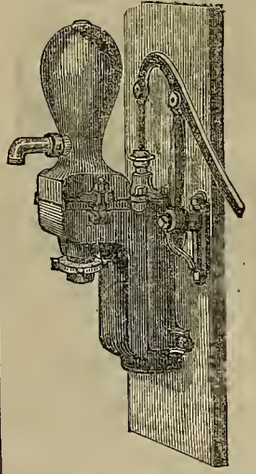
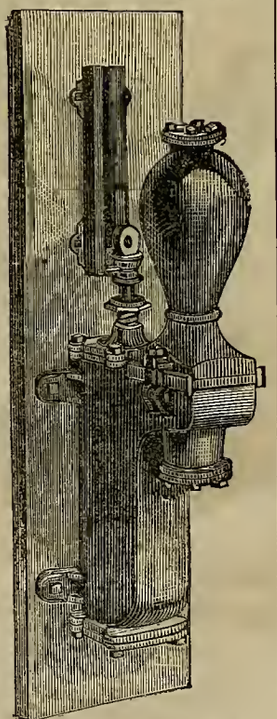
Publishers of the MINING AND SCIENTIFIC PRESS, Patent Agents, Book and Job Printers, corner of Clay and Sansome streets, San Francisco.



HANSBROW'S CHALLENGE

Deep-Well, Mining and Double-Cylinder Patent Pumps.



These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

Six-Inch Mining Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents, LOCKE & MONTAGUE,

☞Send for a descriptive Circular. 112 and 114 Battery Street, San Francisco.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

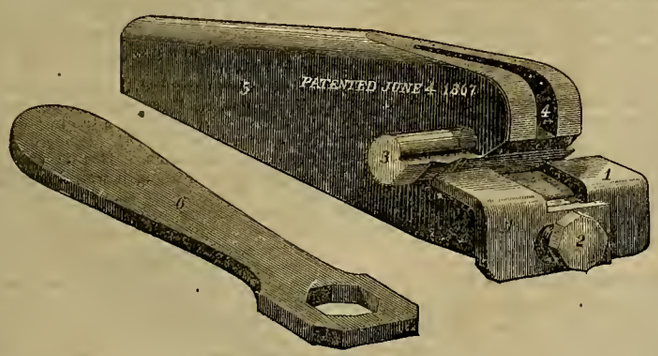
The American Saw Company.

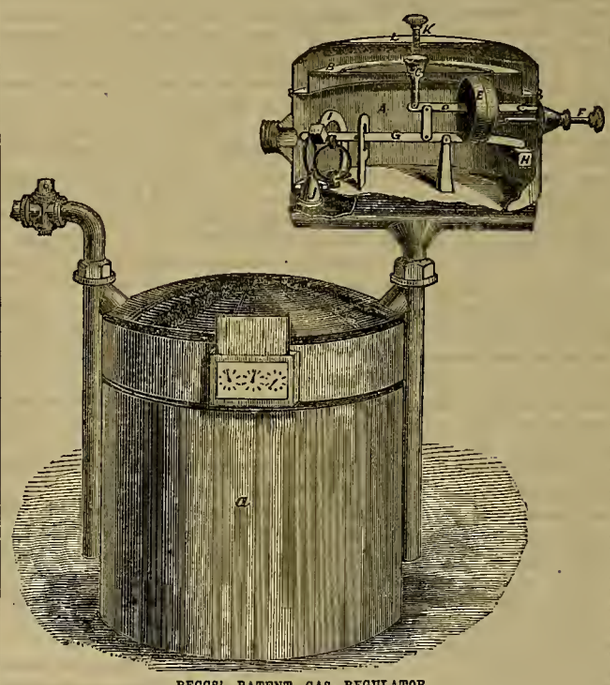


The manufactory of this company is located at Trenton, N. J., with their principal business office at No. 2 Jacob street, N. Y. The saws made by this company have been in use about three years, working in every kind of timber and in every climate. They manufacture two kinds of circular saws, one with movable teeth, and the other with an improved solid tooth. The peculiarity of this latter method of constructing saws, will be readily understood by examining the accompanying figure.

The perforations or half circular holes are on a line with the wear of the saw, and form the base of each tooth as the saw is gradually reduced in size. Many advantages are claimed for this mode of constructing saw teeth. No gumming is required; three-fourths the expense of filing, and consequently of the cost of files is saved; the saw is less liable to be broken, as breaks invariably start from between the teeth, and from a sharp corner made by the file. Should a crack commence it can only break through the bar between the holes or apertures, and go no further. The bars between the holes are *softer* than the cutting part of the saw tooth, are very tough and file easily, so that the corners of the file are not worn out as fast as in filing ordinary saws, while at the same time the cutting part of the tooth is of superior temper. The bars can then be either cut out with a cold chisel, or by filing through them at each end of the bar with a taper file; the bar will drop out and leave a perfect tooth again. Cross-cut and other saws, as well as circular saws, are made with this style of teeth.

It is claimed that wherever these saws have been put into use, they have given the fullest satisfaction. The construction and adjustment of the movable teeth saws, may be readily understood by referring to the company's advertisement. All of these various saws can be seen at the office of the company, 606 Front street, in this city.

In addition to their saws, this company also manufacture a patent adjustable swage, for spreading, sharpening and shaping the teeth of saws. The accompanying illustration, Fig. 2, represents the mode of construction and operation of this instrument; 1, 1, show the adjustable or movable lips; 2, the screw to hold them firmly in position; 3, the sliding-pin containing the V-shaped die; 4, the slot or groove to admit of the swage being used on a fine tooth saw; 5, shows the body of the swage, and 6 the wrench. The movable lips are so constructed as to form the teeth of saws into the most perfect shape, leaving them widest at the extreme points, and on the under side. The tool appears to be a most perfectly devised instrument for the purpose intended. Both this instrument and the perforated tooth arrangement are the inventions of Mr. James E. Emerson, Superintendent of the company's works at Trenton.



EMERSON'S PATENT ADJUSTABLE SWAGE.

THE MISSOURI TIN MINES.—It appears that the reported tin mines of Missouri are still attracting considerable attention. The St. Louis *Dispatch* of a recent date, says that Phelps, Dodge & Co. of New York, have recently paid $50,000 for 1,200 acres of land, supposed to ho valuablo for tin. A St. Louis company has lately expended $7,500 in sinking shafts and putting up machinery upon their property. A correspondent of the *Dispatch* expresses the opinion that the United States will soon be able to export tin from the mines of Missouri.

Beggs' Gas Regulator.

The want of something to regulate the pressure of gas in service pipes, to the proper standard for securing a bright and steady light, with an economical use of the gas, has long been felt and acknowledged. Gas, when burning under too high a pressure, is forced so rapidly through the burner into the atmosphere, that sufficient time is not given for it to properly mix with the oxygen of the air, until at least a large portion of it has passed beyond the influence of the heat derivable from the blaze, by which it should be ignited; that portion consequently passes away unburned, and is of course wasted. But under a proper pressure the gas is all consumed, and the intensity of the light greatly increased.

BEGGS' PATENT GAS REGULATOR.

When the gas is first turned on the proper degree of pressure may readily be obtained. But if turned on early in the evening, the numerous additional burners subsequently lighted and fed from the same street main, so reduces the pressure as to cause an imperfect light; again, if the quantity of gas is increased by turning off a portion of the burners, the pressure will be so great that much of the gas will pass away unconsumed. Thus these changes take place from hour to hour, as the number of lights in any given neighborhood are increased or diminished. You must therefore either be constantly regulating your gas, or your lights will be defective and unsatisfactory.

Now the only practical way to remedy this evil is to procure some arrangement which shall be sufficiently sensitive, and at the same time have sufficient power to do this regulating work for you. Mr. Eugene Beggs, of this city, after considerable study and experiment, has finally succeeded in devising an apparatus which seems to accomplish this purpose most perfectly. This apparatus is connected to the meter, and acts as a perfect governor or regulator to the flow of the gas, and consequently to the pressure with which it enters the burners. When a single burner, of many that may be lighted, is turned off, or an additional one turned on, it is quite surprising to witness how quickly this sensitive and automatic device adjusts itself to the decreased or increased demand for the illuminating medium. No human hand could more quickly or accurately adjust the subtle fluid to its accidental disturbance.

We give herewith a sectional view of this regulator, showing its connection with the outlet pipe of the meter, and exhibiting the interior arrangement of the device. By referring to the engraving, a represents the meter, and A the case of the regulator. B is the diaphragm, which in this apparatus is made of a flexible metallic substance, instead of oiled silk, leather, etc., which allows the gas to escape through its pores. By the use of metal all leakage is avoided, while the requisite delicacy of movement is at the same time secured. The diaphragm B has the post C passing through its center and attached to the end of the lever *D*. This lever is connected with the lever G by a link as shown, and the valve J is attached to the long arm of the lever *G*, so that by the intervention of the series of levers, a very slight motion of the diaphragm very sensibly affects the valve. The lever G has at the opposite end from the valve, a counterpoise *H*, and the lever *D* carries the adjustable weight *E*, which is operated by a rod *F* passing through a stuffing-box on the side of the case. By means of this rod the weight *E* can be moved along the lever *D* to any point, and when once adjusted to any desired number of burners needs no further attention. A curved lever *I* is attached to a standard beneath the lever *G*, and has its short arm attached to the lever by a link. The opposite end of the curved lever passes over the top of the lever G, and carries a weight

which, moving hackward and forward, is increased or diminished in its effects by heing carried furtber from, or hrought more directly over its center of gravity, and thus equalizes the pressure, whether a larger or smaller number of burners are used.

Tbe screw K is designed to stop the action of the regulator, when desired. When screwed down it impinges upon the nut on tbe top of the post C, by which tbe diaphragm is forced down, and the valve J opened to its fullest extent, allowing the gas to pass through, as though tbere was no regulator attached. The object of this arrangement is to readily determine, whenever anything is out of order, where the fault lies, without removing the regulator.

The advantages claimed by the inventor for this over other regulators, are enumerated as follows :

1st. No liquids of any kind are used to seal the gas, which liquids always require attention when used.

2d. There are no drips or places for tbe water and tar to accumulate, which will put out the light if not drawn off in time.

3d. It is easier regulated, as there are no extra weights required.

4th. In changing the meter, it can be taken off and replaced without interfering with its working.

5th. Is the only dry regulator which increases the weight on the diaphragm as the greater number of burners are required.

6th. Is the most sensitive, as a large surface is allowed for the gas to act upon.

7th. The valve never draws up tight to the valve seat, but always hangs loose, which will prevent it from sticking fast.

8th. The gas can pass through without the regulator working, and any one can attend to it, hy turning the screw on the top of the case.

9th. Is the cheapest and most durahle, as well as the easiest to set to work.

This regulator, when properly constructed, fulfills the important office of continuously adjusting the supply, and whether one burner or all on the premises are lighted, it is equally effective ; so that by the employment of proper hurners, and by so adjusting the pressure that it shall not exact four-tenths of that which is required for the size of burners in use on tbe premises, the maximum light is then ohtained from a given quantity of gas, and as there is no irregularity in the hight of the flames, there is no waste and but little smoke. The economy derived from the use of the regulator is considerahle, depending, however, upon circumstances,—such as the pressure of the gas in the locality, the care previously taken in adjusting the kiud of burners employed before and after the instrument, etc. It is claimed by the inventor that it is hy no means uncommon for a saving of 30 per cent. to he effected hy its use, and still retain the same amount of light.

The simplicity of the construction of this device is such that any person can readily understand its operation and attend to it. Its cheapness brings it witbin the reach of every gas consumer ; and all may derive a proportionate henefit from its use, whether they consume much or little gas.

It requires no argument beyond the mere statement of facts as given, to prove the value of such a device as we have described, This apparatus appears to overcome tbe ohjections which have heen urged against the two or three other devices which have been previously introduced to the puhlic, to meet the want of a gas regulator. The public are respectfully invited to call and examine the apparatus in operation, either in day time or evening, at the store of O'Brien, Bush & Co., 539 California, hetween Montgomery and Kearny streets. Tbey may also be seen at the gas-fitting establishment of J. K. Prior, 730 Montgomery street. A patent for this invention has heen obtained through the Mining and Scientific Press Patent Agency.

Chinese Literature.—Mr. Burlingame says the Chinese have more books, encyclopedias, pamphlets, magazines, etc., than any other people. Their principal encyclopedia embraces over 5,000 volumes.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Making of Mortar.

Editors Press.—In your paper of June 13th, there was a communication on the "making of mortar," by Joseph Dysart, of Pennsylvania, to the following effect :

"None of our builders, masons, or bricklayers understand the action of lime upon sand, etc. I take it for granted that lime and sand produce silicate of lime, which is the binding principle in common mortar. It is clear that the longer the lime and sand remain mixed in the condition of mortar, the more of this hinding principle will he produced; but instead of this, mortar is generally used soon after it is made. If the plasterer would mix the slackened lime witb the sand, aud let it stand for a long time, so as to produce the silicate of lime, they would make a hetter joh, etc."

Now, I only wish to suggest, that the above idea is in contradiction with the results of the experiments made on tbis subject hy the hest chemists. Common sand contains the silica in an insoluble state, and slackened lime has no effect on it, unless they are left in contact for a great many years, and then the sand will he found only very slightly corroded, and the quantity of silicate of lime so formed, will be very trifling iudeed. The hardening of common mortar is mainly the result of the action of the air, which by the carhonic acid it eontains produces carbonate of lime, and also a connection of the carhonate with the hydrate of lime. The porosity of the mortar favors this action. It is a different case with the *hydraulic cement*, which contains tbe silica as a hydrate, in which condition it will readily unite with the lime, forming silicate of lime, which is insolnhle in water, and will even harden under water. To determine whether a cement contains the silica in the proper state, it has to be treated with muriatic acid, which, after a little while, will separate tbe hydrated silica in tbe shape of jelly. It is certain that this kind of cement would he prefcrahle for any purposes that mortar is used, if it was not too expensive. Good cement hardens quicker than common mortar, and connects the hricks or stones to a solid mass, as it contains tbe material for the formation of tbe silicate of lime in itself, and does not depend like common mortar on the slow action of the air, which finally produces only carhonate of lime, wbich is not near so durahle as the silicate. E. Pique.

Skilled Workmen.—The *Scientific American* thinks tbe abolition of the apprenticesbip system and the general adoption of machinery, are the causes of the present scarcity of first-class workmen. Certain it is, that if we expect good workmen, we must have educated apprentices. In every husiness but that of mechanics a proper educational preparation is expected and exacted. Let our mechanical apprentices he compelled to pass a suitable examination after a suitable training, and we shall have good workmen.

Acoustic.—Underneath the hall of tbe British House of Commons is a room used as a store room, and partly filled with hot air flues and ventilating pipes which convey fresh air to the chamher. Recently a gentlemen who bad gone into this room to search for something, while standing close to one of these ventilating pipes, was startled to hear a whisper apparently close to his ear. After listening a moment he ascertained that the whisper proceeded from a distinguished member of the Ministerial party in tbe room above, who, during a dehate, was privately explaining to a colleauge the course to be pursued on a certain question. The whisper, inaudible in the chamber itself, was clearly conveyed by means of the pipe to the room below. The discovery may help to explain the manner in which several State secrets, supposed to he inviolate, have hitherto in some unaccountable way become public property.

[Written for the Mining and Scientific Press.]

Martins in San Francisco.

Editors Press :—Your paper of course records in its scientific columns, observations of new facts in Natural History, as well as other sciences; for, though apparently of little consequence in themselves, such facts may have an important hearing on more practical sciences, such as affect our lives or our property.

I wisb therefore to make a few remarks on the occurrence on this coast, of those heautiful and useful hirds,—the martins,—and their allies the swallows. Since 1860, I have noticed almost every May that several pairs of martins (*Progne purpurea* of naturalists, found throughout America) lingered during their migration northward, for several days in this city, hut then disappeared, because,—as I supposed,—tbe sea winds were too cold for them. This year, however, two pairs have remained, finding a nesting place in tbe cornice-work of a high building on Sansome street, near your office, and bave apparently raised hroods, which, according to the custom of the species elsewhere, will douhtless leave for the south in August. This having been in an uncommonly cold season, shows that if the proper boxes, either plain or ornamental, were provided for these hirds and fixed in high situations, inaccessible to cats, etc., many of them would spend the summer here.

We bave always had the cliff swallow (*Hirundo lunifrons*) huilding on cliffs and under eaves, wherever permitted. Many persons drive them away because, as they say, they "hreed" hed-bugs. While living in the country, I investigated this question, and found that the bugs were quite distinct from the chinch or hed-bug of human dwellings, and would not bite, nor enter the house after the nests were torn down. It is well known to naturalists that nearly every species of hird has its peculiar parasite, which is harmless to other animals.

I think a few of the green swallows (*H. bicolor*) have also remained this year, in the southern part of tho city, building in knot holes or other cavities, like the martins. Let us encourage all these insect-eating and musical hirds, to spend tbo summer here and help to enliven our chilly, foggy days. J. G. C.

San Francisco, July 14th, 1868.

The Blush of a Cuttle Fish.—Under the influence of strong emotion the human face turns pale, or blushes; in some individuals it even hecomes blue. The cuttle fish does this, and more. Yielding to the impressions of tbe moment, it suddenly changes color, passing through a variety of tints, and only resuming its familiar hue when the cause of the change has disappeared. It is, in fact, gifted with great sensihility, which reacts immediately on its elastic tissues in a most extraordinary and unlooked-for way. Under the influence of passion man is born to hlush; but under no sort of excitement does he cover himself with pustules. The cuttle fish not only changes color, hut throws out an eruption of little warts. "Observe," says D'Orbingny, "a poulpe in a poole of water. As it walks round its retreat, it is smootb and very pale. Attempt to seize it, it quickly assumes a deeper tint, and its body becomes covered on the instant with warts and bairs, which remain there until its confidence is entirely restored."

Improvements in Gas Manufacture.—At the recent annual meeting of the British Association of Gas Managers, it was stated that upwards of 20 uew appliances in tbe manufacture and distribution of gas were introduced last year. Amongst the foremost of tbem was the plan of using a mixture of small coal with shale oil, as a substitute for cannel coal, for the production of gaslight of high illuminating power.

A French journal announces the arrival in Paris of a Yankee who is about to effect quite a revolution in typography—his invention aiming at nothing less than to enable people to read in the dark.

African Geography 300 Years Ago.

Modern Discoveries Anticipated.

Mr. P. Hatley Waddell, of the city of Glasgow, Scotland, has furnished the editor of the Glasgow *Herald* witb the following statement, which, if correct, is certainly of much interest. It is very singular, however, that the existence of such a collection of maps should have been known for over two years, as stated, without being produced. We give the statement as we find it in the *Herald:*

There has been in my possession for twe or three years past, a collection of ancient miniature maps, to two of which very recently, in consequence of Sir Roderick Murchison's late address to the Royal Geographical Society, my attention has been more particularly directed. One of theso is a general map of Africa, in which the watershed of that continent and the sonrces of the Nile, the Zambezi, and a west-flowing river (Congo or some other river, name unknown) are all represented in a very simple, suggestive, and singular fashion. On reading Sir Roderick's address, I communicated with bim in respect to this map; hut I learn by his prompt and courteous reply that it is entirely new to him—that he has never seen, or apparently heard of it, hefore. The other is an extended map of the Abyssinian Empire, with sonrces of the Nile displayed—in all essential respects so closely corresponding to the most recent discoveries with which we are acquainted that the one, without much practical danger to science, might be readily snbstituted for all the others. In some respects, it supplements discoveries which Speke, Grant and Baker now, and even Livingstone as yet, for anything we know, has left incomplete. Only in one particular does it fall short of what they have actually ascertained; so that the credit of comparative accuracy is so far in its favor. The disoovery of this map also I have notified to Sir Roderick Murchison, but have had no communication since. I may conclude, however, that it is unknown to him, because both maps are in the same collection. To Sir Samuel Baker it certainly must have been unknown, or his silence on the subject is inexplicable. In our best modern atlases I do not find the slightest trace of it, all heing either blank or the wildest conjecture in that region ; and, what is still more astonishing, I do not find any reference to it by the most eminent missionary explorers of Abyssinia as far back as 1624. But both maps, which, along with the rest, were published in 1592, are now extant, in perfect preservation, and testify for themselves in the most indisputable fashion. How they should be unknown to geographers and explorers at this date in the history of the world is certainly a strange enigma. With this map of Abyssinia in his hand, any resolute pedestrian might march right on the source of the Nile from the nearest point on the eastern seaboard of Africa, with not more than one days's deviation from the proper route ; whereas months and years of painful, exhausting, and often fatal fatigue have been encountered, with heroic fortitude and miraculous perseverance, by brave men and devoted women to attain this object—scarcely yet attained. The wonder is, if possible, enhanced when one observes that these maps are each only 3x4 inches square, and that tbe whole region about the source of the Nile—including lakes, rivers, towns, names and all—is delineated in very little more space than a postage or receipt stamp would cover.

It has been suggested to me by those who have examined these singular productions, that I should publish a tracing of them both, with a few pages of letter-press to illustrate their bearings. If this suggestion should be acted upon, it would certainly be with no desire to provoke any scientific discussion—a thing for which I have no disposition—but simply to present the public with what seems to be a very rare scientific curiosity, that those who are more directly concerned in such inquiries may examine and judge for themselves. Certain it is, that with all our achievements of discovery, we can claim neither monopoly nor precedence any longer in such triumphs, for the very fields in which our greatest modern triumphs of this sort have been surveyed and mapped by some unknown, or at least nameless, Portuguese wanderer, between 200 and 300 years before any man now living was born, and its delineation published, with ecclesiastical and royal permission, to Continental Europe 276 years ago.

Ten per cent. of the works of art exhibited hy the Philadelphia Academy during the present season, are by women.

Mechanical.

The Steam Engine to be Superseded.

In the last edition of Mr. Bourno's "Treatiso on the Steam Engine," that eminent engineer expressed the conviction that "the steam engino would pass away before many years," and somo other and more economical motor come into use, in its stead. Reference was made to this fact in our issno of Jnno 13th, 1868. The engineering world was somewbat startled by this announcement; not because its enunciation was new; but because of the high authority which then made tbe utterance. More recently, and within a few weeks, Mr. Bourne has given to the world the first issne of another work, which is to be completed in twenty-four numbers, and wherein the author proposes to place his readers in possession of all the important facts with regard to the progress of the steam engine from the days of Watt to the present time, to review the expedients which bave been proposed as substitutes for the steam engine, and to analyze tbeir respective degrees of merit and promise. The work will also contain practical and illnstrative drawings and descriptions of the best forms of air, gas and magnetic engines which have already been devised, with suitable commentaries and critical investigations thereof, with the object of deterring from tho adoption of the bad and doubtful, and leading toward the best types now available. In alluding to this enunciation, and to the first number of Mr. Bourne's new work, which had then jnst appeared, the *Engineer* of Juno 12th, says:

We have long heen acqnainted with many of the views with which the present work will no donbt startle the engineering world, and evidences of this knowledge will bave been observed by the attentive reader of our pages to he occasionally cropping out, though we refrain from laying any connected statement of it before the public. And if the engineers now awako to the perception of the great fact that the steam engine is slipping from their grasp—tbat it is a moribund expedient, now about to be superseded by other motors more simple and less expensive—it will not he without an effort that they will have heen roused from their ancient somnolency, nor will it he without much intermediate scepticism that they will finally arrive at this salntary conviction. It is probably to the anticipation of this phase of unbelief that we must attribute the references which Mr. Bourne bas given to his past counsels and predictions—under the idea no doubt that his authority would be thereby snfficiently fortified to lend the necessary weight to his present expositions to ensure their fair and intelligent appreciation. Most persons who should venture to appear before the engineering public with the announcement that tbe steam engine was about to be done away with would be in danger of being set down as ignorant enthusiasts, to whom no heed need be given; but such a conclnsion can bardly be arrived at when the intimation is made by a person already widely known for his intimate acqnaintance with the subject, and when, furthor, it is remembered tbat he is the author of most of the improvements which have been introduced into the steam engine since Watt's time, although the real origin of these improvements has not hitherto heen revealed. * * * *

The reflection presses itself upon us, as it will, no doubt, do upon our readers, that snch a work coming from such a quarter indicatea the impending supersession of the steam engine as a prime mover, and must be regarded as the beginning of the end. A revolution so enormous has not occurred in our day; and the public curiosity will be intensely excited to learn what superior agent is likely to take the place of the ancient servant now about to disappear.

An English engineer, now in New York, writes to tho London *Engineer* as follows: "The cast iron here astonishes me. I saw in Brooklyn Navy Yard a cast iron naval gun which had heen hit by a Southern shot about four feet from the muzzle, and the shot had left its mark, impressing the rifling quite clearly. There was not a crack upon the surface of the gun, but the dint was driven right through the thickness of the gun and reproduced in the chase, so that a closely fitting shot could not he fired from it."

Heavy Machine Tools.—Modern improvements largely require the production of exceedingly heavy work, combined with accuracy of detail and finish. This demand calls, in turn, for machine tools of comparative magnitudo and weight. Among the principal tools nsed in the machine manufacturing works of Wm. Sellers & Co., of Philadelphia, is a planer, the capacity of which is, length 45 feet, width 10 feet, hight 8 feet. The same establishment has a radial drill with a 10-foot projecting swing-arm, and a boring drill of 8-foot swing. These works have recently constructed a 24-foot vertical boring and turning machine for the Charlestown Navy Yard, whose total weight is over 72 tons. This machine was fully described in our colnmns of March 21st. A second tool of the samo dimensions, and to be constructed after the same patterns, has been ordered for the Washington Navy Yard.

New Mode of Operating Slide Valves. Isaac Church, Jr., of Norwalk, Conn., has jnst patented an improvement in operating tho slide valves of steam engines and pumps applicable more specially to direct double-acting steam pumps, and it will snffice here to regard the same in snch connection. The improvement is based upon that principlo of action, which has before been applied in various forms, in which the valve controlling tho action of the piston is shot or worked alternately in opposite directions by steam admitted through the agency of secondary valves that are opened and closed by the motion of the piston. But this invention differs from previous devices of the character referred to, in causing the main valve to be thrown or shot by steam admitted through puppet valves so arranged as that the engine piston operates in a direct manner upon their stems to lift, and it may also to drop them, and wherehy not only are all outside connections for operating the valves dispensed with, but a most simple and efficient interior valve-operating action or arrangement secured.

Hair Cutting by Machinery.—Hair cutting by machinery is now an accomplished fact, so far as horses and oxen are concerned, and it seems by no means impossible in the of the human head. M. Nabat has invented a mechanical razor, which, in principle, is something like a lawn-mower. A helix, with steel blades tangent to a comb, is made to rotate hy means of a flexihlo chain worked by a lever. One man works the lever, while the "operator" promenades the comb over the body of the animal, regulating the length of hair to be left, hy the inclination of the comh. It is said that horses and other beasts enjoy being clipped by machinery. It, however, remains to be seen whether humanity will.—*Mechanics' Magazine.*

Mr. J. F. Bennet announces that he can remove sulphur and phosphorus from pig-iron, during its treatment in the Bessemer process, hy introdncing into the converting vessel carhonic acid gas, either before or with the air blast. He asserts that sulphurons and phosphoric acid are formed at the expense of the carhonic acid gas, the carbon of which is liberated. The gas is produced by acting on hrimstoue by hydrochloric acid, or by burning carbonaccous matter and storing in a gasometer.

Superiority of American Cast Steel. Experiments recently mado at the Navy Department, Washington, with cast steel resulted in favor of an American hrand—that of tho Black Diamond Company, Pittsburg, Pa.—which atood the extraordinary test of 242,100 pounds tensile strength to the squarc inch, being the highest on record, and showing a superiority over English manufacturo.

Mr. Fairbairn in 1840, predicted that, in the course of four or five years, iron would entirely supersede wood in shipbuilding; and he subsequently gave his opinion that the whole navy of Great Britain must be remodeled and rebuilt of iron—in framework no less than in armor.

The iron bridge on the line of the Catasauqua and Foglesville Railroad is the longest iron structure of the kind in the United States, the extreme length being 1,165 feet, and hight 90 feet.

Before 1829 it required about five pounds of coal to carry ono a milo. In that year Geo. Stephenson reduced it to 2.41 pounds of coke. It can now be brought to less than a qnarter of a pound per ton per mile.

Scientific Miscellany.

The Source of Light in Flame.

It has until recently been taught tbat the light of flames is altogether due to the ignited particles of solid matter liberated in the hurning gases. Recent experiments, however, have proved that this is not true in all cases. In burning hydrocarbons—whether a candle or hydrocarbon oils—the oxygen of the atmosphere first unites with the hydrogen, hy reason of its greater affinity for that gas than for carhon. If there is not an excess of oxygen present, the particles of carbon will be set free and pass off as smoke, or be deposited in the form of lampblack. Tho union of the oxygen and hydrogen is made without any material production of light or flame. The flame and light is due to the burniug particles of solid carbon which vibrate, momentarily, with the evolution of waves of light, and are then consumed or converted into a invisible gas. If we hold a piece of white crockery in a hydrocarbon flame, it is immediately blackened hy a deposit of carhon, whicb is cooled by the contact, and arrested in its progress of consumption. If we bold a piece of the same crockery in an oxyhydrogen flame it will not be blackened, for the reason that there is no carbon present.

When an electric light is projected upon a screen, it is distinctly noticeable that the brightness of the light is produced by the two ignited solid carbon points, while the space between them is almost dark—the little light that is visible is due to tbe passing over of fine particles of the carhon from the positive to the negative pole.

But all flames are not thus due to the ignition of particles of solid carbon or other solid matter. It has recently been shown that compression has much to do with tbe production of flame. Oxygen and hydrogen contain no solid matter, and hence it has been supposed that the flame produced hy their combustion could not be made to give out light. Recent experiments, however, have shown that when these snbstances are ignited by an electric spark, in a very strong glass vessel, they give out a most intense light. This light is due to the compression produced by the expansion of the gases at the moment of ignition.

The brightness of the electric spark may be largely increased by compression of the atmosphere through which it is passed. If we attach a glass tube to a force pump, and produce the electric spark within it, while the density of the air is being constantly increased hy the action of the pump, the luminosity of the spark will increase with the increasing density of the atmosphere in the tube, and fall off with the decrease of its density.

Various other experiments of a similar nature have recently been made to prove that the rule which influences the production of light in flames, without the presence of solid particles, is,—that the denser the products of combustion, the greater is the light produced.

Meteoric Stones have fallen in unusual quantities during the last six months. Birmingham, in England, has recently been visited hy a shower of these celestial missiles, which fell in the streets of that city in great quantities during a very heavy rain storm. They were about the eighth of an inch in length, and greatly resembled the meteoric particles that fell in similar abundance on the 12th of June, 1853. Prof. Loomis says 8,000,000 stars shoot through the earth's atmosphere every twenty-four hours, some of them very small, weighing 480 to the ounce.

Gases from Volcanoes.—In a report from the French Academy of Sciences, in 1858, is expressed an opinion that the gaseous emanations from a volcano, carefully analyzed and compared, will throw light on the chemical process which gave them birth; and enable observers in tho vicinity of a volcano, and through them the surrounding population, to foresee the course which a coming eruption is likely to run, and of course serve as a useful warning.

The Gold-Bearing Rocks.—Sir Roderick Murchison, in tbe now edition of his "Siluria," has modified the views first put forth by him as to the distribution of gold in the earth's crust. His most recent conclusions are:

1. That looking to the world at large, the auriferous veinstones in the lower silurian rocks contain the greatest quantity of gold.

2. That where certain igneous eruptions penetrated the secondary deposits, the latter have been rendered auriferous for a limited distance only beyond the junction of the two rocks.

3. That the general axiom before insisted upon remains, that all secondary and tertiary deposits (except the auriferous detritus in the latter) not so specially affected never contains gold.

4. That as no unaltered, purely aqneous sediment ever contains gold, the argument in favor of the igneous origin of the metal is prodigiously strengtbened; or in other words, that the granites and diorites have been the chief gold producers, and that the auriferous quartz-bands in the palæozoic rocks are also the result of heat and chemical agency.

Phosphorescent Photographs.—The Berlin *Archiv* for April gives tbe following method for making photographs which are invisible in the light, but are luminous in the dark: Sulphate of baryta (heavy spar) is finely pulverized, mixed with gum tragacanth and heated in a closed crucible. Instead of heavy spar, a carbonate of haryta, strontia, or lime, with half its weight of sulphur, may be used. The pulverized product should he kept in a closed bottle. A sheet of albumenized paper is moistened with wet blotting paper; when sticky the powdered substance is distributed equally over it hy a tuft of cotton and then dried in the dark. It is printed under a glass *positive.* Only a few seconds are required when baryta is used; with magnesia a little longer time is needed. In the dark, the light portions show the peculiar phosphorescent luminosity, the dark portions being distinguished by a want of phosphoresence. The picture will, however, slowly disappear. When required to keep, the picture is made on a film of paraffine poured on glass, and covered while still warm with the powder, and treated in the same manner as the albumen paper.

Curious Application of Musical Notes. One of the most interesting uses to which it has been proposed to apply musical notes is that lately suggested by Mr. Airy, an English practitioner, who suggests that through their agency the strain exerted upon bridges and other girders may be very accurately ascertained; the notes given out by girders of the same length and structure at any given tension being identical, so that any difference in the notes will indicate a corresponding difference in the tension. The experiments of Mr. Airy were made with a model of an ordinary how-string bridge; and *Engineering* suggests that the same process may be employed to advantage in the construction of large and complicated iron structures, and also for ascertaining the strains on the arched roofs of railway stations and the ties of suspension bridges.

Interesting Experiment with Hydrogen.—M. Cailletet announces the extraordinary circumstance that hydrogen will pass through iron even at the common temperature on certain conditions. He caused two thin iron laminæ to be welded together round the borders, so as to form a large artificial blister. To this was welded a thin tube establishing a communication with the hollow space left between the two plates, and the whole apparatus so constructed was plunged into a bath of dilute sulphuric acid. The numerous bubbles which escaped through the open extremity of the tube being collected in a receiver, were ascertained to be hydrogen.

New Method of Preparing Magnesium. M. Reichert has devised a new method of preparing magnesium. He takes 1,000 grammes of the anhydrous double chloride of magnesium and potassium, pulverizes it, and mixes it with 100 grammes of finely powdered fluor spar; this mixture is fused with 100 grammes of sodium. The compound proposed for use occurs in the mineral kingdom in tolerable abundance as carnalite. White pieces of this mineral are available, and require no previous treatment; colored fragments must he dissolved in water, the impurities allowed to settle, and the lixivium evaporated.—*Druggists' Circular.*

Leading Book Concern of America.

Sometime since we gave a pretty full description of the priuting and book manufactory of Messrs. D. Appleton & Co., situated in the city of Brooklyn. While in New York, lately, we visited the new store of this firm, and were pleased to see the completeness which the Appletons have attained in the construction and adaptation of their new huilding to their extensive trade.

Their business has been handed down from father to sons; the latter profiting by experience, now conduct a business economically and systematically, which other persons equally intelligent, but less practical, would lead into utmost confusion.

A fine portrait of the Appletons' father—a countenance betokening straight-forwardness—is among the elegant decorations of their reception room. The elder Appleton's first book was a tiny affair; and yet in those infant days of American book-publishing, it received more deliheration thau a full-sized volnme, destined to reach its twentieth thousand, now receives.

In three months, the sales of Dickens' works at this house amounted to over 500,000 volumes; Mulbach, in the same period, also reached over 300,000; and Cornell's series of school books, 200,000.

If the educational advancement of a nation may be noted by the increasing sales of books, this indicates rapid progress in the United States. Appletons' new building is located at Nos. 90, 92 and 94 Grand street, corner of Greene, two blocks west of Broadway, and was built expressly for their trade, which had outgrown their former location on Broadway.

As the leading book house of America, a brief description of the store will be of interest; but a visit alone can convey an adequate conception of its elegance and magnitude. It has a front of 75 feet on Grand street, and 100 feet on Greene, and is five stories high. The front on Grand street is of sandstone, and that on Greene street of brick, with sandstone facings. Large and elegant iron pillars flank the doorways on both streets, and give additional snpport to the structure. The cost of the building was $160,000. The basement, 75 by 100 feet, is a general stock room. Here may he seen great piles of cyclopædias, school books, and Dickens' and Scott's novels, and the standard works of the house, fresh from the Brooklyn book factory. Under the sidewalks are ranged the "subscription books" of the house,—an important department of its business. Broad flights at each end of the basement lead to the first floor, which is perhaps the busiest place in this busy establishment. Entering through the western door on Grand street, the visitor will find himself in the retail department. The business of this branch is conducted precisely the same as in the Broadway store, though it occupies less space on the premises. The fittings are in oak, rich and neat, which, in a word, is the style of the furniture and decoratious throughout the building. Adjoining the retail bureau is the subscription department, which has grown into an immense business within a few years, and is still steadily increasing. Next, to the left, is the city branch, which is a complete book store in miniature, intended for the supply of the local trade. Ascending to the second floor by the wide, easy staircase, or by the easier elevator (which lands one on every floor in succession) the first object of interest to the casual observer is the ample and beautifully furnished suit of business offices on the Grand street front. On this floor also is the educational department, through which the colleges, academies, and common schools of the country are furnished with those standard works the enumeration of which occupies several pages of the catalogue. The distribution of some of the leading popular school books, such as Webster's spellers, Cornell's geographics, and Quackenbos' arithemetics, constitutes of itself an enormous business. The third floor is similar in general respects to the floor below, and is full of juvenile books, poetry, works of fiction, photograph albums, etc., etc. The poets have a corner to themselves, as in Westminister Abhey, though here their works are anything but dead. Theology and Spanish literature are on the fourth floor. The fifth and last floor serves the purpose at present of a store-room for goods in bulk. Of all the leading books, it is the intention of the Appletons to keep a very largo supply always on hand.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

Issued for the Week ending July 14, 1868.

79,820.—Improvement in Chimney Cowls. J. W. Foard, San Francisco, Cal.:

I claim the ventilator, composed essentially of the pipe A, and cowl C, united by the connectiou-pipe B, the cowl having the expanded end c, to receive the air to create the current, and the elongated cylindrical or parallelopipedon discharge end c′, for the purpose described, all the said parts being constructed and arranged to operate together, substantially in the manner specified.

79,880.—Improvement in Gano Plow.—James T. Watkins, Santa Clara, Cal.:

1. I claim the plows H, H, in combination with the blocks E, E′, the holding-screws I, I, by which the plows are adjusted, and the wedges a, a, constructed and arranged substantially as described.

2. The blocks E, E′, mounted upon the axles C, C′, and the bent arms J, J′, with the set-screws K, K′, for regulating the depth of the furrows, substantially as described.

3. The bent arm N, and connecting-rod O, with the handle M, and the catch P, for disengaging the plows, substantially as described.

4. The bent axle R, with the nut R′, and the screw S, for raising and depressing the furrow-wheel, substantially as described.

This invention relates to an improved method for regulating the depth of the furrows, as well as a device for instantaneously disengaging one or both of the plows from the earth. For this purpose the plow standards are firmly attached to axles extending across the frame. From these axles, arms or levers extend forward so as to rest on cross-bars, and they may be raised or lowered by means of set-screws, thus regulating the depths of the furrow.

Two other bent levers are also attached to the axles before mentioned, which may be operated separately or connected by a link or rod. By these, one or both plows can he thrown out of the ground at once, and held by a catch or spring. To regulate the relative hight of the furrow wheel, the axis on which it turns is bent so as to form a vertical arm, and at the top again bent to a horizontal position where it forms a strong nut. A long screw works through this nut, and by its operation raises and lowers the wheel.

79,903.—Improved Fire Kindling.—Chas. Gaudin, Zoe Granier and J. Granier, San Francisco, Cal.:

I claim forming a fire kindling ball upon the end of an inflammable wick, for the purpose of ready ignition as herein shown and described.

79,954.—Ore Crusher, Grinder and Amalgamator.—John A. Collins, Virginia City, Nev.:

1. I claim the combination and arrangement of the cylinders C, crushing wheels D, axle E, and central plate F, with arms projecting downwards and supporting said axle, substantially as described.

2. The combination and arrangement of the driving-plate G, on the shaft H, the friction rollers N, on the arms of the revolving plate L, and the stationary plate K, above it, substantially as described.

3. The combination and arrangement of larger rollers L, with smaller S′, within the cylinder C, the former rolling upon the latter and upon the cylinder, but the latter or smaller rubbing and grinding against the cylinder as described.

This invention was fully described in our issue of Nov. 2d, 1867, page 276, Vol. XV.

80,014.—Improved Apple Corer and Slicer.—Isaac Rogers, West Chehalem, Oregon:

1. I claim the combination of the slide-bars F, cross-bars H, tube M, knives N, and rim O, with each other and with the guides or slides G, and parer-fork Q, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the adjustable guide P, with the rim O, and slide bars F, substantially as herein shown and described and for the purpose set forth.

3. The combination of the cross or foot-bar J, and levers I, with the bottom board A, and cross-bar H, of the sliding-bar F, substantially as herein shown and described and for the purpose set forth.

Notices of Recent Inventions.

79,425.—Improvement in Machine for Kiln Drying.—Ashbel B. Winegar, San Francisco, Cal.:

1. I claim a machine for drying salt and other substances, composed of the furnace A, pan or disk B, the radial arms G, G, spindles H, H, with the hoes or stirrers I, I, I, attached to them, with the movable bar J, for turning them in different directions, so as to continually stir and turn the salt in the pan or discharge it at will from the periphery, the whole constructed and arranged to operate substantially as herein described.

2. The sliding board or plate O, at the bottom of the hopper, operated by the spring P, cords S, lever T, and beveled pinion U, substantially as and for the purpose specified.

The object of this invention is to provide an improved kiln for drying salt and other substances that require to be kiln-dried before being reduced or prepared for market. It consists in the construction of a furnace, of masonry or iron, circular in form, or any other shape whose outlines and dimensions shall answer the purpose. Over the furnace is placed a drying-bed, or disk of iron or other material, the whole being surrounded by a rim, with the necessary discharge-opening. A suitable vertical driving-shaft, having its step in the center of the disk, is suspended by frame work above the furnace, by means of which a series of radial arms, having stirrers attached to them, is rotated.

In operating the machine, the salt or other article to be dried is admitted to the pan through the hopper, which discharges through the center. The stirrers are so constructed and arranged as to spread the substance evenly over the surface of the drying-bed. The machine may be so operated as to make it self-feeding and self-discharging in action. The discharge may also be effected into an elevator or other convenience by which it may be transported to the mill for grinding. The furnace may be so constructed that either fuel or steam may be used for drying.

77,880.—Carriage Spring.—Walter B. Higgins, San Francisco, Cal.:

I claim the combination of the springs D, D, with the wooden spring A, to form the connection of the same with the body of the carriage, substantially as described.

The object of this invention is to construct and attach springs to single and double wagons and carriages. It consists of a continuous wooden spring, combined with other springs of a spiral or elliptical form, or of any elastic material, which are placed at the front and rear ends of the wagon-body, and connect it to the continuous wooden spring. By this simple device a cheap wagon-body, with an ordinary spring attachment, may be made to ride easily, and without the jar occasioned by the occasional coming down to its bearing or axle. The danger of the breaking of springs when riding over a rough road is also greatly removed by this device. The springs will also last much longer and with much less cost for repairs, than when used without this device.

Recent Inventions.

New Hydraulic Mining Invention.—The Nevada *Transcript* described a new mining invention recently brought out in that city as follows: "We noticed yesterday at the shop of Crawford & Leavitt, on Main street, an ingenious combination of distributor and monitor for hydraulic mining, which promises to supersede everything of the kind heretofore in use. This invention, of John Jacobs, dispenses with the distributor, and is used without any hose whatever, making an immense saving. It throws water to any part of the horizon; a great desideratum in hydraulic mining; and allows at the same time all necessary dip, while it does not injure the stream like the "goose-neck." It is pronounced by good miners to be perfect. We learn that an 11-inch machine will be got up for exhibition at the State Fair. The one we have described was on its way to Quaker Hill for trial in Jacobs & Sargent's diggings. Mr. Jacobs has been over a year perfecting his invention, and filed a caveat several months ago at Washington.

In Rome, a city having 200,000 inhabitants, there is but one newspaper, and a poor one at that.

Capital and Labor—Can they Coöperate?—This important question is answered in a startling manner in the *Scientific Review* for June. That logicians and mathematicians would object to the argument can matter little, provided it he legally and commercially conclusive. It is attempted to demonstrate that a manufacturer whose capital in stock, plant, etc., is of the estimated value of 6,000*l.*, the profits thereon 600*l.* per annum, or 10 per cent., and who pays 3,000*l.* a year in wages, can, by the mere adoption of the coöperative principle, place himself in a position to pay 30 per cent. higher wages to his workmen, and obtain 13 per cent. instead of 10 per cent. for himself; or, in other words, that he can, with the advantages of the coöperative system, so divide the 600*l.* profit that *out of it* the workmen shall receive 900*l.*, and himself 780*l.* The benefits of coöperation have never before been put forward in so favorable a light, nor has it ever before been so satisfactorily proved that by means of coöperation the "loaves and fishes" can be so admirably manipulated, even in modern times.—*Exchange.*

If the *Review* will read and reflect upon what has been written and said upon this matter, there need be no "mystery" about it, whatever. The figures, impossible as it may appear, may be in spirit, if not in letter, approximately, if not fully realized, under the coöperative system. The result must of course be obtained from the increased *amount* of labor that may be obtained from the same number of workmen within the same time. If £900 in gold cannot be got out of £600, it is at least a very easy matter, under the coöperative system, to get £900 in value of labor, out of a cost, which, under the old system, would yield only £600 in value. There is nothing like giving a man an interest in his labor, over and above his wages. The effect is magical. It has been tried within the last three or four years, in almost all kinds of business, and in establishments employing from a few hundred dollars of capital up to millions; and never, so far as we have learned, has such an experiment worked disastrously to either capital or labor. With the coöperative system so successfully demonstrated as it has been within the last few years, it is astonishing that any intelligent class of laboring men can be induced to resort to the pernicious and unprofitable system of "strikes" to right either real or imaginary wrongs between labor and capital.

Mining Profits.—It would appear from statistics given in the commercial departments of our city papers that mining was on the average a largely losing business. For instance, we read that the dividends for the first half of the present year were only $904,000, while the assessments have been $732,200, thus giving a total profit to our incorporated companies of only $160,890, for the many aggregated millions invested.

These facts by no means submit a fair basis on which to fonnd a judgment with regard to the general condition of our mining interests. But very few of our best paying mines are incorporated; and when they are incorporated it is upon such an extensive basis as to leave margin for but a very small interest on the capital invested. People in this State when they have a really good mine, and are able to work it, are very seldom anxious to sell on terms that will admit of any profit in the investment to the purchasers.

Holders of mining stocks have been peculiarly unfortunate the past year, as will he seen by comparing the figures above given, with those for a corresponding period of last year, which may he stated as follows: Last year the aggregate dividends amounted to $1,983,200, and the assessments to only $332,280—leaving a general profit of $1,650,920. As will be seen, the dividends disbursed this year show a falling off of over $1,000,000 as against last year; at the same time, the assessments have been increased over $400,000.

Continental Life Insurance Company, 302 Montgomory street, corner of Pine.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, August 1, 1868.

City Stocks.

The market for miscellaneous stocks shows no improvement over last week. San Francisco Gas stock was dealt in to a limited extent at $77 per share. The usual monthly dividend is payable to-day. Considerable sales of Spring Valley Water stock were made at $66. The second installment of scrip issued by this company is payable to-day.

We call attention to the following interesting statements of two of our prosperous interior savings banks, as published in the *Commercial Herald* of this city:

Sacramento Savings Bank.—This institution was incorporated March 19, 1867. Its first semi-annual report was made January 1, 1868, and out of the earnings they dishursed a dividend of 1½ per cent. per month, free of Federal tax. The report for the six months ending July 1, 1868, just at hand, compare as follows with the previous report. For the latter term they pay to depositors a dividend of 1 per cent. per month:

	January 1, 1868.	July 1, 1868.	Increase.
Depositors	345	881	486
Deposits	$163,905 30	$429,929 14	$266,023 84
Loans	162,453 70	364,594 50	202,140 80
Gross Earnings	8,648 07	18,449 75	9,801 68
Reserve Fund	1,150 46	3,017 96	1,867 50
Expenses and Federal Tax	1,438 80	2,226 55	787 75
Cash on hand	9,472 80	118,063 43	108,590 65

Stockton Savings and Loan Society.—We are indebted to the Cashier, James Littlehale, for the following statement of the operations of the Stocktou Savings and Loan Society. The institution was incorporated August 12, 1867, and commenced business Septemher 21, 1867. The capital stock is $250,000, of which ten per cent. has been called in:

Capital stock paid in to June 30, 1868	$20,030 00
Open deposit accounts	287
Deposits	$181,167 72
Loans	141,410 74
Gross Earnings	11,388 29
Reserve Fund	3,000 00
Expenses and Taxes	4,261 93
Cash on hand	64,329 08

This is the first report rendered by the above society, and speaks well for the short time it has been in existence. For the term under review, a dividend of 1¼ per cent. per month has been declared on the capital stock paid in, and the same amount on deposits. The expenses have been much larger than they will be in the future, owing to the purchase of office fixtures, safe, etc.

Mining Share Market.

The mining share market has exhibited less animation this week, and for the most part stocks rule lower. The outside speculative transactions are less numerous than for some time past, and upon the whole the sales in the Board have fallen off considerably. In the absence of encouraging information as regards the developments in the lower levels of the various claims on the Comstock lode, necessitating additional outlays of money before largely increased returns are visible and can be estimated, we may look for a drooping market. The following remarks on this subject by a local paper are quite pertinent: "For ourselves, we do not believe there are any good reasons to warrant serious apprehensions as to the continued productiveness of this lode. That recent developments in the lower levels of certain claims along it have failed to disclose any heavy bodies of pay ore is admitted. Yet this has before happened, having almost invariably been followed aoon after by the discovery of rich deposits a little further down. The metalliferous masses in the Comstock vein lie, as in most masterly lodes, chiefly in honanzas, or chimneys, which geuerally have a slope iu the linear direction of the vein. Hence a vertical shaft sunk on a lode of this kind must necessarily pass through alternate sections of productive and barren veiu matter, as experience has shown to be the case in the Comstock mines."

Savage—sold to a considerable extent, declining from $136 to $130 50, advancing to $133 25, and closing yesterday at $133. Extracted 1,273 tons of ore during the week ending July 25th, showing an average assay value of $39 68 per ton. Of the above amount the south mine on the fourth station yielded 922 tons. Owing to necessary repairs the production is lighter than usual. In the north miue, on the fifth station, the main drift runs iu a mixture of quartz and porphyry, showing no ore; and the east cross-cut passed through the quartz found in the face a fortnight ago, and is now in porphyry looking like "east country." The west cross-cut, at 105 feet, encountered a soft seam of quartz and considerable water, which is uow being cleaned out. In the south mine, same level, the breasts are reported to look very fair, and show no material change. The south drift has been carried a few feet beyond the south line, and has been stopped for some days. The ore up to and beyond the liue is of very good quality, and twelve feet wide where the last cross-cut was made. This cross-cut has not yet reached the east clay, and the Snperintendent has great hopes of finding another seam of ore next to this clay. The sixth station drift has been started toward the ledge. The receipts of bullion to date for Jnly accouut foot np $224,000.

Hale & Norcross—has been less active than last week, though the sales have beeu large, advancing from $75 to $80, receding to $75 50, rising to $87 50, and closing at $88. The drift from the fifth station of the Savage extends five feet into this company's ground, and an average assay of ore from the face shows a yield of $68 86 to the ton. On the 27th of July the south drift in the lower level was in seventy feet from the main tunnel, leaving about 150 feet to reach the Savage line.

Crown Point—was in the market to a moderate extent, selling within a range of $86 50 and $90, and at the close realizing $89. No material change has takeu place in this mine since our last reference. A telegram of July 31st says, the 900 drift is in 99 feet, and running in hard rock. The returns of bullion to date for Jnly account aggregate $86,894 07.

Kentuck—advanced from $372 50 to $382 50, and closed at $384. The receipts of bullion from July 1st to 27th aggregate $83,758 26 against $58,001 82 same time in June, showing a gain for July of nearly $26,000. From September, 1866, to July, 1868, this company dishursed twenty-two dividends—one every month—amounting to $441 per share, or $9,284 per foot.

Yellow Jacket—was in better request, rising from $1 120 to $1,222 50, falling to $1,105, and closing at $1,177 50. It is reported that a very fair body of ore has been found on the 730 and 810 levels, and that from the latter they are at present extracting about 150 tons of ore per day. At the annual meeting, on the 20th of July, the following gentlemen were elected Trustees for the ensuing year: William Sharou, John B. Winters, Thomas Sunderland, Thomas G. Taylor and Charles Bonner.

Imperial—has been less active, selling at $105@108, then at $103, and closing at $107. Another shipment of $9,850 has been received, making a total of $33,255 37 so far for July account. A telegram of July 31st says—"Have made three feet in drift since yesterday; face in quartz and porphyry. Commenced to raise twenty feet south from main drift."

Chollar-Potosi—declined from $146 to $133, improved to $141, and closed at $142. Extracted 1,088 tons of ore from the Blue Wing stope dnring the week ending July 24th. The drift from the 1,000 level is in 104 feet from the incline, and from the 1,100 level the northeast drift is in 43 feet, and the sontheast drift 44 feet.....Ophm sold at $19 50@22, closing at $21 75. On the 29th of July the new shaft was 360 feet in depth, 347 feet being timbered.

Overman—was in fair request, selliug at $75 @80, and closing at $81. Extract about fifty tons of ore daily, and is said to be improving in quality and increasing in quantity as they go south on the 361 level....Segregoaten Belcher was in the market at $11@12, closing at $12. On the 10th of July $4,400 in bullion was received. Another remittance of bullion will soon be made.

Sierra Nevada—declined from $33 to $31, and closed at $35. Reports to the 24th of July state that the surface ore is still looking well, and that they will soon extract about sixty tons per day. On the 710 level the east drift is in twenty feet, and the west drift twenty-five feet. Here they fonud a clay wall, dipping to the east. A considerable flow of water washed ont some quartz, and it will take about two weeks before they can ascertain what it will amount to.

Daney levied an assessment of $2 per share on the 27th of July; and Lady Bryan $10 per share on the 25th of July.

The sales in the Board during the past week have been as follows: Open sessions, $514,327; regular sessions, $1,570,093. For the month of July, $8,478,968, against $9,078,063 in June.

Good for the Health.—All who are sick of the dust, noise and bustle of the business portion of the city, or are worn out with care and anxiety, will find a visit to Woodward's Gardens better for the health and spirits than any medicine, and more exhilarating than the Excellent. *

There has been filed in the Secretary of States' office, the resolutions and order of increase of the capital stock of the Central Pacific Railroad Company, from $10,000,000 to $100,000,000.

If your eyesight is beginning to fail, try Muller's Spectacles, No. 205 Montgomery street, Russ House Block. *

San Francisco Prices of Copper Ores.

San Francisco, July 31, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.		Per ton.
12 per cent. ore	$16 00	22 per cent. ore	$43 56
13 " "	18 62	23 " "	46 46

20 " "	37 78	30 " "	66 66
21 " "	40 67	31 " "	69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

Art and Science.—Writers are quite too apt to use the terms *Art* and *Science* without proper discrimination and precision with regard to their exact meaning. In general, an art is that which depends on practice or performance, and science that which depends on abstract or speculative principles. Music is both an art and a science—the practice of music is an art; its theory is a science.

Pure science is built on self-evident truths,—as mathematics. But the term science is also applied to subjects which are founded upon merely generally acknowledged truths, as metaphysics, etc. Chemistry and physics are far from being pure sciences. They are generally said to be founded on experiment and observation; but in reality they are both founded upon mere assumptions. The first has for its foundation, and is dependent for its progress, upon the atomatic theory; the second is equally as dependent upon the theory that an etherial medium pervades all space. Yet both these facts are simply *assumed*, and have never been proved.

Theorizing often leads to important truths. In fact, it is the surest and readiest way to the inner courts of nature. Even a false theory may often lead to great truths; but the true philospher will abandon his theory the moment he obtains the evidence that it is unreliable.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, July 25th: The machinery for the new Kennedy quartz mill will all be finished this week, and the most of it is now on the ground. The boiler is being set, and all parts of the work is being pushed forward as fast as possible.

Amador County.

Dispatch, July 25th: The arch of the furnace at the Coney & Bigelow mine, used for roasting sulphurets, fell in a few days ago, causing considerablo delay and expense to the proprietors. It will be repaired and put in operation as soou as possihle.

Mariposa County.

Gazette, July 24th: The Oaks & Reese Co., Hunter's Vallcy, have been taking out some very rich rock lately.

Snediker & Co. are prospecting a quartz claim on the point of the mountain east of Mount Bullion. The vein is abont ten inches wide, and well defined. In working it with an arastra the prospect is good.

We were shown hy Mr. Brownfield, of Hornitos, two exceedingly handsome specimens of gold-bearing quartz. They weigh about $80, and were taken from the Duncan lead, near Hornitos, by Barcroft & Co.

Dave Morrow and Jerry Fenton are working a claim on Saxton's Creek, which would deter less energetic men. They havo to use a derrick to move the boulders, the smallest of which is about the size of a flour barrel. The claim pays, however, abont $4 a day to the hand, and occasionally they pick np a *chispa* of some ounces.

The *Alta* of this city, says: The Ryerson process continues to give the utmost satisfaction at the Bear Valley mill, and would have been in use at the Bentou mill but for the destruction of the Merced dam, and the financial tronbles of the Mariposa Co. The success of the Bear Valley mill in extracting $35, andeven $45 per ton, by the Ryerson amalgamator from the Josephine ore, which had not paid more than $8 by the old process, was on a scale too small to prove the richness of an extensive body of quartz.

Nevada County.

Transcript, July 23d: Mr. Hazlett has sold the Kansas claim to A. D. Allen, for $2,500. Work will commence immediately.

A friend writing from You Bet informs us that Capt. Atkins & Co., at Little York, have started up two sets of hydraulic claims and are working with fair prospects of taking out a large amount of money.

At You Bet, the Yuba Canal Co., it is expected, will shut the water out of their ditch in a few days, and afterwards mining operations will be confined to drifting in the blue lead. G. S. Brown's claim is paying as large as usual. Neece & West are also doing well. Ed. Williams has got good pay in the old Mallory claim, and at Hnnt's Hill they are taking out considerable money. There will be a great deal of prospecting done this season, and no doubt many good mines will be opened.

July 26th: We saw at the banking honse of Geo. W. Kidd & Co., yesterday, a beautiful bar of gold, valued at $5,600, which came from a set of diggings at Chalk Blnff, in Little York Township.

The Banner mine has shut down for the pnrpose of putting a new boiler up at the hoisting works. The old boiler commenced leaking so badly as to be nnfit for use. The new one will be four ft. in diameter.

Peters & Co. have located 15 claims, each 20 ft. front, and running from the Main Gnlch to the center of Mooney Flat Hill. The ground is west of Mooney Flat Ravine, and adjoins Cook & Co's ground.

July 27th: The Rothschilds Mining Co., composed of David Stevens and others, have located a claim of 3,000 ft. on a quartz ledge, at Lawton's Ranch, six miles south of Grass Valley.

Millenbrock & Co. have located 400 ft. on the extension of the Ypsilanti ledge at Randolph Flat, Rough & Ready Township.

A Chinese company, working a short distance below the suspension bridge, in the bed of Deer Creek, seem to be doing well. They have conveycd the water of the creek through a flume, and use it for a motive power to keep the bed of the creek upon which they are working dry. They have a large number of men employed, and are cleauing out the tailings to the bedrock very fast.

The miners about Birchville and French Corral are beginning to run short of water. The ditch supply of this locality carries about 4,000 inches, and the Americau Co. alone is running 1,100 inches, and a larger part of the water is used above Birchville.

On Wednesday morning about 10 o'clock, the flume of the South Yuba Canal Co., across Steep Hollow, came down with a crash. The flume was 275 ft. long and 60 ft. high. As it conveyed water for the supply of mining in this as well as other localities, operations have to be suspended until a new flume is built. The ditch conveying water from Deer Creek, will bring sufficient water to supply the town. The flume will be rebuilt in about eight or ten days.

Gazette, July 27th: Work was resumed on the Lucky mine last Thnrsday. The mine has been idle for some months.

July 28th: The spur wheel at the hoisting works of the Sneath and Clay mine, broke down yesterday moruing. Mulloy, who has charge of the works, has made arrangements to have another wheel cast at the Nevada Foundry, which will be completed in a few days, when the works will again he started up.

Grass Valley *National*, July 21st: Kaiser & Co. have located 1,000 ft. on an extension of the Garden City ledge, and organized the Nevada Mining Co. for the purpose of working the claim.

July 25th: We were shown to-day some samples of quartz taken from the seventh level of the New York Hill mine, which were the richest with which our eyes have been blessed for many a day. The mine is a splendid one, and is daily improving.

Excelsior.—A Meadow Lake correspondent of the Dutch Flat *Enquirer*, of July 25th, says: The Enterprise furnace and mill is ready for operation; the Trustees are expected here daily, and will appoint a Snperintendent, and take into consideration other matters preparatory to a season's operations. They have at the mill two month's run of good ore, hut the ability of the furnace to work it thoroughly or even profitably, is as yet uncertain.

The U. S. Grant Co. have struck a fine looking ledge in their lower tnnnel, at a depth of 80 ft. The Trustees are expected from San Francisco in a few days, to decide regarding the erection of a mill.

The Kentucky Co. has also tapped the ledge 100 ft. deep, eight feet wide; prospects flattering.

The Gold Run Co. have levied an assessment sufficient to pay all indebtedness, taxes, etc. Their mine is well prospected, by a tunnel running on the ledge 300 ft., and is not surpassed in richness hy any mine in the district. The Trustees have determined to suspend work until some process is put into operation that will work the ore thoroughly.

The Mohawk and Montreal Co. have a fine body of decomposed free-gold ore, at a depth of 230 feet, and the prospects throughout the mine are very flattering. They are putting a new 48-flue boiler in the mill, and another 5-stamp battery will be ready to start in a few days.

The Empire Co. will resume work this week. Their shaft is 35 ft. deep, the ledge five feet wide and very rich in free gold and sulphurets. Free gold can be seen in the pnre sulphurets as taken from the mine. They have out about 75 tons, of which, they will work 30 tons at the Enterprise soon.

The Green Emigrant Co. are at work day and night. Their shaft is 65 feet deep, the ledge five feet wide, the rock white, free gold and some sulphurets. It paid last season from $26 to $31 per ton, and the indications are better now than ever.

Many other mines in the district are just as good as those above mentioned, some of which have been located and partly prospected, others are subject to location.

There are five mills in the district which have proven that the ordinary process will not work this ore.

Placer County.

Dutch Flat *Enquirer*, July 25th: A correspondent at Gold Run furnishes the following interesting items: Moore, Taylor & Co., after a run of 20 days, cleaned up quite a handsome sum ... O. Harknes, of Cañon Creek, after a 20 days' run, cleaned up hetween $7,000 and $8,000. This is the largest clean up ever made in this District in the same length of time.... Abeel, Dunn & Co., after running 10 days, cleaned up at the rate of $50 per day.... There are quite a number of claims that have stopped work for the present season, on account of their ground being nearly worked out.... Carr, Harriman & Co., cleaned up after a run of twenty days the sum of $2,800. This claim is under the supervision of J. G. Brown.

Sierra County.

Downieville *Messenger*, July 25th: The Good Hope Co. are running the Montpelier Mill, to crnsh about 50 tons of rock from their ledge.

We understand that the boys mining in Woodchuck Ravine, Mohawk Valley, are getting a fair prospect. Judging from appearances the diggings in that valley will be valuable when developed.

The Monumental mining claim at Howland Flat, recently struck excellent pay, having taken out last week for the work of four shifts, 94 ounces, and for the following two shifts, 92 ounces of gold.

The Nip and Tuck Mining Co., near Mt. Pleasant, have their shaft down 250 feet, which takes them to the bed-rock. The bottom shows good gravel, and all their prospects are favorable. They have their main tunnel in 200 feet, and expect to get in the coming winter. They have fine steam hoisting works in first rate order.

We saw at the Banking House of H. Scammon, on Monday last, a nugget of gold from the Gold Lake diggings of Watson & Co., weighing over 23 ounces. This piece, together with about 25 ounces in pieces, weighing from one ounce down to pennyweights, was the result of one week's work of nine men.

The Kingom Bros., of Poverty Hill, have done remarkably well in their mining claim this year, having taken out about $20,000. There is a large amount of good ground in this vicinity, and when the drain tunnel is finished, 60 or 70 companies can work to good advantage. By another Spring the St. Louis Water Company will have their ditch in, which will make Poverty Hill, beyoud a doubt, one of the richest and liveliest mining camps in the mountains.

The *Alta*, of this city, says: The Ryerson process is to he introdnced at the Gold Valley mine, in Sierra County. That mine has for years proved rich in the assayers' crucible, but poor in the ordinary mode of amalgamation. It is said that the royalty of $5,000 demanded in advance for the privilege of using the Ryerson has stood much in its way. The general opinion of intelligent miners is that it is excellent for quartz in which the gold is found in extremely fine particles.

Siskiyou County.

Yreka *Union*, July 25th: John C. Klimper, who mines on the South Fork of Humbug, took out of his claim one day this week a handsome nugget weighing eleven ounces. A few weeks since Mr. Klimper found one weighing $50. These nuggets are very handsome and entirely frec from quartz or other foreign substance.

Tuolumne County.

Sonora *Democrat*, July 25th: We saw recently at Kelly's mill some very rich rock from the Van Tromp mine, near Columbia. The rock is of a whitish blue color, with black strata running through it, and shows a great deal of gold to the naked eye. Indeed we have seldom seen richer or better looking quartz. A shaft has been sunk on the mine to a depth of 75 feet, and the rock, to that depth, is all of the same character. Several tons has been crushed at the Summit Pass and Shanghai Mills, and has paid from $63 to $100 per ton. The vein is ahont two feet wide and very accessihle.

The flume of the Golden Rock Water Co's ditch, near Big Oak Flat, fell on the 9th, with a tremendous crash, crushing everything in its way, and creating a total wreck. The flnme was the most magnificent structure of the kind in this State. It was designed by G. W. Holt, and erected by Holt and Conrad in 1859, under contract with the G. R. W. Co., at a cost of $80,000. The water first passed through it to Big Oak Flat on the 29th of March, 1860. It was built of sugar pine mainly. The flume was 2,200 feet in length.

COLORADO.

Georgetown *Miner*, July 4th: The Herkimer is yielding a large quantity of rich argentiferous galena.... Work will soon be commenced on the Anglo Saxon lode.... A tunnel ii being driven to strike the Summit lode, on Griffith Mountain.... Bellamy, Hatch and Vance uncovered four fissure veins at East Argentine last week by washing the debris off the mountain.... Harris and Campbell are workiug the White lode, on Sherman Mountain. Their labors are being well repaid by the prodnction of a large quantity of first class ore.... The shaft on the Comet lode is now down betweeu 50 and 60 ft., carrying a body of very rich orc. Drifting will soon be commenced.... Stewart's smelting furnace is rapidly approaching completion.

Herrick, of the smelting works, has commenced the erection of a new cupel furnace.... Juo. T. Harris is raising some very valuable argentiferous galena from Elijah Hise lodc, on Sherman Mountain.... C. J. Goss is engaged in developing a new discovery, the Geo. B. Walker lode, on Brown Mountain. The vein is large and well defined, carrying a large body of ore.... The Policy lode, on Democrat Mountain, will be actively worked during the season.... Work has commenced on the Henry Ward Beecher lode on Democrat Mountain.... We have been shown some very fine specimens of ore from the Wm. Penn lode, on Democrat Mountain. Rigshy informs us that the vein is opening up finc with a large hody of first class oro.... Work has been resumed on the Parr lode, on Sherman Monntain.... David A. Griffith & Co. are engaged in driving a tunnel in Alpine Mountain. It is now in some 50 ft. and has already cnt a galena bearing vein. The tnnnel is named Daniel Drew.... Hill and King are opening a new discovery on Burrell Monntain, called the Woodhine. At a depth of 10 ft. they have from four to six inches of fine appearing mineral, that is increasing in quantity as work progresses.... Gnitens & Co. are actively working the Hercules lode on Brown Mountain. The vein has averaged, to a depth of 20 ft., 18 in. of argentiferous galena, and on Saturday last opened out to four feet in width of the quality of ore. The ore will yield $500 per ton, dressed.

Denver *Herald*, July 11th: In Gilpin County, gulch miners are wanted at $3.50 to $4, and lode miners at $3.25 to $5 per day.

Denver *News*, July 8th: The Antona mines are located about 40 miles west of Fort Sauders, and near the line of Colorado on what is called Antana river, about ten miles from its mouth. There had been four gulches discovered up to the 30th of June last, named as follows: Antana river, Beaver Creek, Horse Gulch, and Elk Gulch. The first has been prospected abont eight miles; the second about four miles; the third about two miles, and the last about one mile. Timber is plenty, grass abounds, and there is a good road to the mines. Spicer & Co. at the mouth of Horse Gulch, make $7.50 per day.

The placer claim of Taylor, Thompson & Co., at Helena, is worked night and day. A car load of dirt is washed every minute and a half. The pay streak presents a square front from 30 to 35 ft. deep, and no nnderlying bedrock yet nor the slightest indication of any. The weekly expenses average $2,200 in currency, and the net proceeds $6,000 in gold. Forty-five men are constantly employed. Ahout $100,000 was taken out of the claim last year; that amount will, of course, be greatly increased the present.

DACOTAH.

New Mexican, July 7th: Four or five arastras are being constructed and a quartz mill will he in operation hy the middle of July. Several parties have gone east to purchase mills for the redaction of the quartz, which will be working by next fall.

The placer diggings are being worked at considerable profit, paying from $5 to $30 per day to the hand. Rich placer diggings have recently been discovered 12 miles south of South Pass City, which are attracting considerable attention, and bid fair to yield a large quantity of gold.

That the country has great mineral wealth, there is not a particle of doubt, bnt it will take time to develop it.

The Virginia *Enterprise* has the following, dated South Pass City, July 22d: The Pioneer quartz mill of the Sweetwater mining country, Tozer & Eddy, proprietors, commenced crushing rock this afternoon from their claim on the Cariso ledge.

The Sweetwater *Mines* of July 3d, says: The first crushing of ore ever done in Sweetwater was done Friday, June 26th, at the splendid power arastra of Messrs. Fairfield, Bronson & Marshall.

IDAHO.

Lewiston *Journal*, July 4th: During the week, a 10-stamp mill, manufactnred by Goddard & Co., San Francisco, was shipped to Warren's Camp, for the Pioneer mill Co. The capacity of the mill will enable the company to crush 20 tons in 24 hours.

A party of five started for a prospecting trip in the mountains to the east of Oro Fino. This part of the country has been left unprospected, and there is every indication of a good mining district in that direction.

Both the Pioneer and Hic Jacet mills are now running. The Pioneer will soon have new and much larger machinery, with complete apparatus for the reduction of the ore. The Hic Jacet has a road already constructed to 14 of the best leads of the camp, and is ponnding away at the rock as fast as brought to them from these leads. The Sanderson & Co's arastra mill, will be on the ground next week. The Miners' mill is still in this city awaiting shipment.

The same paper states that C. A. Robeson has made another raise in San Francisco, and induced a party to prosecnte a search for his fabulous quartz lead. The editor thinks such expeditions a detriment

and a curse, tending to blight future attempts to discover new mining localities.

July 11th: A quartz lode has been discovered within about 30 miles of this place. The indications are that it is a positive lead, rich enough to work.

Owyhee *Avalanche*, July 18th: The Oro Fino steam hoisting works recently put in operation on the mine, works splendidly. The shafts and drifts were all filled with water, which would be got rid of last evening. Joe. Low, an able and experienced mining superintendent from Virginia, Nevada, has taken charge of the mine.

A correspondent of the Walla Walla *Statesman* writing from Warren's Diggings, says: The proper limits of this camp is about 13 miles in length, by about five in breadth; besides Miller's Camp and the mines of South and East Salmon Rivers, all draw their supplies from this place. We have now in operation one 5-stamp mill, crushing quartz, and one 10-stamp mill nearly completed.

The mills here have reduced the price of crushing to $20 per ton for gold, and $50 per ton for silver. In fact, we have but one mill where they have any furnace for reducing silver ore. Such a mill, properly conducted, with good, experienced amalgamators, would prove a richly paying business to the owners, besides being of great benefit to the quartz miners. For instance, a lead named the Alaska, was discovered here last week, which prospects $600 per ton in gold, and $1,500 in silver. A large proportion of this silver it is impossible to save with our present machinery process. The gold will pay well for the miller and miner. The Winfield Scott has yielded from $80 to $290 per ton. The W. B. Knott about $100, and the Capitol will probably yield about the same. These are the principal ledges being worked at present, but there are several companies on each. Preparations are now being made for opening several other veins, which the high price of reducing has caused to lie dormant until now.

The same paper says: Ex-Mayor Whitman, just down from Warren's Diggings, has left with us specimens of quartz taken from leads in that vicinity, which certainly give indications of being very rich.

MONTANA.

Helena *Post*, July 17th: From Rochester district we learn that everything is prosperous in that vicinity, new and rich discoveries being made almost daily. The Watseka Mill is kept abundantly supplied with rock, and is running regularly. James and Irviu are running an arastra on ore from the Dunderberg lead, and clean up, on an average, $33 to the ton. Among the richest of the late discoveries is that of the Income lead, the decomposed quartz from which has prospected as high as $2 to the pan. The C. F. Sisson lode, recently discovered by Mr. Matthews, has a crevice two feet in width. The ledge consists principally of decomposed rock, which yields 50 cents to pan. Mulvy & Co. have been running a drain ditch in Rochester Gulch with good prospects of being amply rewarded for their enterprise. They are now sinking a vertical shaft for the purpose of ascertaining the depth of the bedrock.

The new discovery at Cascade Gulch, 15 miles from Jefferson City, gave rise to quite a brisk stampede from this city on Wednesday, and some 30 claims were staked. Prospects of from three to ten cents to the pan are obtained. The pay streak lies some four feet from the surface, and it is from eight to 14 feet to bedrock. Timber and water in abundance can be easily procured. The miners' meeting for the organization of the district is to be held on Sunday.

Hubbard & Co's bedrock drain, at Emigrant Gulch, commenced last spring, has been constructed a distance of 350 ft., and has reached a point 30 ft. below the surface, and probably not more than ten feet above bedrock. The gravel through which it is now being run, prospects 2½ cents to the pan. About eight miles above the mouth of the gulch, several companies are stripping and sluicing, and making $18 per day to the man, in coarse gold, resembling that of Trinity Gulch.

The correspondent from German Gulch says: German Gulch is now principally worked by ground-sluicing and piping, 14 companies owning nearly the whole gulch above lower town. The California Flume Co. have a splendid flume, and get rich pay, an experimental clean up yielding over $800, to only three riffles in a week's run. A steam derrick will soon take the place of the one now worked by hand in this claim. F. Brown & Co. are averaging $15 to the hand, with their flume. Alfield & Co., and Julius Pohl & Co., are making preparations for a big bedrock clean up, in ground sluicing off acres of ground.

Capt. J. P. Hillis & Co. cleaned up $1,272, ten days ago, the result of a two weeks' run upon top dirt, from Last Chance Bar at Diamond City.... Big boulders and beaver dam begs seriously interfere with the practical working of the Wilson Creek mines.... King & Gillette's bedrock flume, below Diamond City, being supplied with an abundance of water, is rapidly increasing in length, but has not yet reached bedrock.... Benton Gulch, seven miles from Diamond, in the direction of the Deep Creek country, is creating some excitement in the vicinity of Confederate.... Good diggings are reported to have been struck over beyond Georgetown, on Tenderfoot Gulch, at its junction with Cañon Creek.... Marley's ditch, from Cañon Creek to Howe's Gulch, opposite Georgetown, was completed and the water turned in day before yesterday.... The mill of A. Hauauer, on the Thompson lode, at Cable, commenced operations yesterday.... The Plymouth G. & S. M. Co., of Montana, contemplates putting up a 10-stamp mill in Greenhorn Gulch, for the purpose of crushing rock from the Wild Pilgrim, War Eagle, or Gem lodes. The machinery of the mill is adapted to 20 stamps, and this number will eventually be used if the enterprise proves a success.

The Owyhee *Avalanche* says: The report is that Phillipsburgh, Flint Creek District, Montana, is a failure.

The St. Louis and Montana Mining Co's mill at that place had ceased work, $41,000 in arrears. Wabus, Parks, Pucket, Bradley, Dagenhart, and many others, are flat broke. It is now very certain that there is no positive ledge there.

NEVADA.

Humboldt.

Winnemucca *Argent*, July 23d: There are some 16 mining districts in this county, all of which are known to be coursed with many kinds of mineral veins—the chief being those of silver.

The impetus which the railroad will impart to the development of the native resources of Humboldt County can scarcely be over-estimated. Gold, silver, copper, lead and salt will be the leading mineral exports, though a variety of others will swell the list, as they are known to exist.

The Golconda mine, in Gold Run district, is one of the remarkable deposits of silver ore in Nevada. The vein is from five to ten ft. wide and easily mined, very little blasting being required. The company's 8-stamp water mill, at Fairview, is far more than supplied with ore, and the last clean-up was shipped from here on the 15th inst. There were 2,376 ozs. crude bullion, from a run of five days, and is estimated worth about $1 per oz. It is shipped in a crude state, therefore its value is only approximated by returns of previous lots forwarded. The cost of mining, hauling and milling does not reach an average of $15 per ton.

The Winnemucca correspondent of the Virginia *Enterprise* of July 24th, says: The Montezuma works, at Oreana, J. C. Fall & Co's two mills at Unionville, and the Golconda mill at Fairview, are all constantly at work with large profits; while Holt's mill at this place, and the Etna at Dun Glen, are at work, mostly with some success. Gold Run and Battle Mountain districts are among the most promising of silver districts. The ledges are large, easily mined at small expense, and ore from different ledges pays well by mill process, as shown by repeated crushing at the Golconda mill. The Union Series Co. are making a mine of a large and rich vein in Winnemucca Mountain, three miles from town.

Pahranagat.

Virginia *Enterprise*, July 28th: Judge Burns, of this city, left last night by the overland route for White Pine. As a sad duty before taking his departure he exhibited to us a letter from a friend, informing him that they have got the "big thing" out there. Their first class rock pays $8,000 per ton—second class $1,000. We have not heard the yield of the third class, but it is doubtless immense, and the bedrock rich for miles around.

Reese River.

Austin *Reveille*, July 18th: This morning Gen. Page brought into our office a chunk of ore from the Keystone claim in the district of White Pine, which is the finest sample of horn silver ore we have seen from the district. The piece weighed 33 lbs., and was estimated to be worth $10 a pound. As large a sum as $200 had been offered for the lump, but the offer was rejected by the owners. There are spots in the piece of almost pure horn silver, into which holes had been bored with a common brace and bit.

A handsome ledge of sulphuret ore was cut this morning in the shaft of the Toiyabe Co. at the depth of 210 feet. At the point where it was cut the ledge is eight inches thick and of promising appearance. An assay of a sample of the ore made by Boalt & Stetefeldt gave a yield of $202.62 per ton.

Boalt & Stetefeldt received to-day 2,236 ounces of crude bullion for smelting and assaying.

The Manhattan mill produced for the week ending this date 27,172 ozs. of crude bullion.

The 53 tons of ore from the Garrison mine in the Cortez district, yielded 23 bars of bullion of the value of $19,474.62. The bullion is of very low grade.

Yesterday afternoon some 2,300 ozs. of crude bullion were brought into this city from Rigby's mill in the district of San Antonio.

July 20th: The mill of the Combination Co. in Silver Bend district, is running its whole battery of 40 stamps, and is producing daily bullion of the value of $2,200.

For some cause the mill of the Silver Peak and Red Mountain Co. has been delayed beyond the time anticipated for its opening, but the latest report fixes the time of its opening two or three weeks hence. There is a large amount of gold bearing ore ready for the mill.

July 22d: The Combination Co's mill is now turning out some fine bullion, and the yield is quite prolific. On Sunday five bars were melted, and yesterday four. Some 20 bars have already been turned out during the past eight or nine days. The company's hoisting works are now fully repaired, and steam was got up for the first time on Monday. Tuesday the engine was set to work drawing out the vast quantity of water which has accumulated in the shaft.

July 23d: The 4-stamp mill of Dr. Young recently erected in Columbus district, has been set to work crushing ore. We learned this morning from a miner from Ione district that several mines were producing excellent ore for the Knickerbocker mill, which had been repaired and commenced running this week. The mill company owns the Indianapolis ledge, which is yielding a fair amount of fine ore, and the Victory and Storm King, owned by other parties, are also producing regularly lots of excellent ore. Besides these ledges the owners of several others were working them with advantage, and were adding to the stock of ore for the Knickerbocker mill.

We were informed by Gen. Page, who returned to this city from White Pine district on Saturday morning, that prospecting and mining were carried on in the liveliest spirit. Treasure Hill, on which the claims are located, is several miles long, and it contained nearly as many locations as Lander Hill. A considerable number of the claims showed good ore. The Eberhardt South, the Keystone, and the Aurora had produced masses of rich ore; the amount taken out of the former claim was estimated at upwards of 100 tons. It was opened to the depth of 20 feet, and developed a great face of remarkable looking ore.

Nevada *Transcript*, July 27th: A crushing of 53 tons of ore from the Garrison mine in Cortez district, Nevada, produced bullion of the value of $19,474. This shows a yield of $370 per ton.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, July 20th: A water-wheel for Birdsall & Carpenter's mill, at Dayton, 30 feet in diameter, 5 inches thick in the rim, 14 inches wide, and weighing 5 tons and 500 pounds, has just been cast at the Gold Hill Foundry.

The Twin mine, at Silver City, is furnishing sufficient ore to keep the Sherman Mill, five stamps, and the Eagle Arastra Mill in constant operation. The rock is principally gold-bearing and pays very well by being screened and judiciously assorted.

July 25th: The Overman Co. are taking out a large amount of ore in their 361-foot level which assays over $30 per ton. The Vivian mill is now crushing for them, and they will shortly set the Excelsior mill to crushing the same quality of ore.

The Bonner on the Gould & Curry shaft has attained a depth of 1,000 feet. At this depth they find the rock tolerably soft with favorable indications of ore. They are still extracting a large quantity of very fair ore from their old surface workings. The Confidence Mining Co. shipped $3,350 worth of bullion to San Francisco on the 18th inst. The new drift at the 900-foot level of the Crown Point mine is over 60 feet, and running in soft rock.

Evans' & Co's mill, situated at the foot of Cedar Hill, has been in operation some three days on ore from the Sacramento mine. It works satisfactorily in every respect.

Wells, Fargo & Co., shipped during the past week from their offices in this city and Gold Hill, 13,818 pounds of assayed bullion, valued at $353,195 04.

Trespass, July 25th: The 5-stamp Sherman mill is kept constantly at work on rock from the Twin mine, situated at Silver, as is also the Eagle Arastra mill, both under the management of Milton Mygatt, Esq. The large mill of Joseph Trench has been idle for some time, owing to the scarcity of ore, but the Sherman and Eagle have their own ore near at hand and are not likely soon to shut down for want of rock.

Gold Hill *News*, July 24th: There was shipped from Wells, Fargo & Co's Gold Hill office this morning, 43 bars of bullion, weighing 3,690 pounds, and of the assayed value of $85,716 26.

The July receipts of the Savage Mining Co., from the 1st to the 21st, aggregate $114,509. About 1,480 tons of ore per week is now extracted, averaging $38 47 per ton.

The new shaft of the Ophir Co. is now down to the depth of about 350 feet. They have comparatively little water to contend with, but find the rock very hard.

Gold Hill Branch Assay Office of E. Ruhling & Co., received this morning for melting and assay, 4,659 ounces crude bullion.

July 25th: There was shipped from Wells, Fargo & Co's Gold Hill office this morning 7 sacks of bullion, weighing 512 pounds, and of the assayed value of $16,862 32.

Gold Hill Branch Assay office of E. Ruhling & Co., received this morning for melting and assay, 8,045 ounces crude bullion.

OREGON.

Dalles *Mountaineer*, July 17th: Mr. Judy reports that gold has been found in the vicinity of the new settlement in Ochoco Valley. Near Cañon City, Mr. Wolfinger employs 40 men, and his claims are paying better than ever before. The hydraulic diggings at Marysville are yielding well.

Eugene *Journal:* Some prospectors in Jackson County, sunk several prospect holes on Cayote Creek, and found a prospect sufficient to warrant them in the belief that their claims would pay from $8 to $10 per day to the hand, when worked properly.

Portland *Oregonian*, July 18th: The party of miners who left this city some months ago, on a prospecting expedition to the Stickeen River and other streams to the north, returned here by the steamer Active, having made no discoveries of gold anywhere. They report the country barren and the streams altogether destitute of deposits of earth or gravel.

A friend just from the mines of Idaho and Eastern Oregon, represents the mines of that county to be extremely dull, the miners being mostly without water to carry on operations with. There has been no water of consequence since early in the spring. Great numbers are leaving, some going to other mines, others returning to Oregon and California, while many are going overland to the States. Those who have had water, have been doing nearly as well as usual. In the regions of Shasta and Willow Creek, few men are staying with their claims, waiting for fall rains.

NEW MEXICO.

Santa Fe *New Mexican*, July 7th: The ditch for carrying water to the mines near Fort Garland is almost completed.

The news from the Moreno mines continues favorable. Work upon the claims is progressing, and gold in large quantities taken out daily. When the ditch is completed from Red River, there will be employment for thousands who are now idle for want of water. In the meantime, the country surrounding is being thoroughly prospected, and many new diggings discovered.

The Pinos Altos mines are doing well. Several large shipments of gold have been lately made, and the mills are pounding away day and night. Several furnaces have recently been erected for the purpose of testing the silver ore so plentiful in that locality, and large results are anticipated.

India Rubber is a wonderfully elastic material, and can be stretched to an infinite variety of shapes and uses. It is singular that no enthusiast has attempted to make a collection of the different articles manufactured from this gum: they would stock a tolerably large cabinet. The latest adaptation of this accommodating substance is about to be made by a firm in Bridgeport, Conn., who propose to build coaches and carriages with india rubber bodies. This is a capital idea, and might with still greater advantage be applied to city stages and horse-cars. There would then, perhaps, be really always "room for one more."

The profits of the *London Times* for the last year are reported to have reached the large sum of $500,000.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

MR. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

DR. L. G. YATES is our duly authorized traveling agent. July 6, 1867.

MR. A. B. BUTLER is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

San Francisco:

Saturday Morning, Aug. 1, 1868.

CEREALIS, Napa.—The remarks you allude to, which appeared in a San Francisco daily, respecting it being premature to form an opinion as to the probable yield of the current year's harvest in England, and that probably the telegraphic reports of the favorable prospects there, have only a bearing operation in view, is not founded on a very deep knowledge of the circumstances which in England produce serious fluctuations in the corn markets; some of which, for your information, we will hereafter allude to. The paragraph under notice, described the accounts received of the English wheat prospects, during May and June, as being unfavorable. In the most favorable seasons, in England, the wheat plant invariably looks *sickly* during the month of May; nor does the plant receive a healthy character, if drouthy weather occurs, for a rather lengthy period. The sickly character described is usually denominated, among English farmers, as "spayning," and is caused by the plant, at this period of its growth, ceasing to derive any material nourishment from its coronal or seed-roots, or those by means of which it had been nourished previously; the top or deep roots succeed, which penetrates the soil to a considerable depth, and so possessing a larger area for obtaining its food. Respecting anticipation of the future harvest, excepting in extreme cases of climatic vicissitudes, no serious efforts are attempted to estimate the future harvest yield, until the month of July, at which time the wheat plant is in flower, and when it is always in a critical period. If fair weather prevails at that season, the wheat harvest of the year will, *cæteris paribus*, almost invariably prove good; the exception only occurring on the occasion of an extraordinarily wet reaping season following, which very rarely happens in years when the flowering season has proved favorable. So well known are the facts named, that the term "weather markets" is commonly applied to the corn markets held for about six or eight weeks of the months of July and August. The facts noted are worth the careful attention of the wheat growers of California. We subjoin by way of illustration of the popular opinion in England as to the appearance of wheat at the time of spayning, the following doggrel quatrain:

"If you go and look at your wheat in May,
You will come weeping away;
If you go again in June,
You'll come away with a merry tune."

SINAPIS, Santa Clara.—The statement made respecting the value of mustard-seed in Liverpool and Paris, is totally erroneous. The value, on an average, in Liverpool, does not exceed six cents per pound, in place of twenty-four and thirty cents, as announced by some projectors. The brown, or as it is usually called in this State, wild mustard seed, if placed in the market in good condition, will usually obtain a price thirty per cent. higher than the white, or common garden mustard-seed. This arises from the circumstance that the white mustard-seed contains nearly double the weight of a mucilaginous oil, as compared with the wild variety, *(sinapis nigra)*.

The Institute Pavilion.

The Pavilion in which is to be held the forthcoming Exhibition of the Mechanics' Institute, is now completed and open for the reception of goods. This edifice, covering upwards of 70,000 superficial feet, and rising over 80 feet from base to ridge, has been completed in just 52 working days; although, as the carpenters commenced almost simultaneously with the parties engaged in grading the ground, but few men could be put upon the work during the first week or ten days. The dispatch with which the work has been done is fully commensurate with the skill manifested in the design. Mechanics are now engaged in setting the boilers which are to furnish steam for the motors. The boilers are placed in a suitable room outside of the main structure. We notice that they bear the card of the Miners' Foundry as makers.

The motors will consist of three engines, to be furnished, one each, by the Pacific, Union and Miners' foundries.

Exhibitors should make all possible haste in getting their goods into the Pavilion and ready for exhibition. The Fair will be opened promptly upon the day set—next Saturday—and it is especially desirable that everything shall be in readiness by that day, so that exhibitors may obtain the full benefit of all the time allowed them, and the public find the exhibition complete in all its details, on the first opening.

Among the novelties not before noticed as coming in, we may mention the Coffin & Standish Steam Plow, with which our readers are already quite familiar, and which is further noticed in another column of the present issue.

Mr. Newman, of San José, will exhibit the first piece of silk ever manufactured in this State, and will make an exhibition of the entire process of silk manufacture from the hatching of the eggs, up through the reeling of the silk from the cocoons, and the weaving of the silk into dress goods. He will have a loom at work upon a wide piece of taffetee, from thirty to forty inches wide. Five or six hands will be constantly employed in this interesting department.

Mr. Prevost will also make a fine exhibition of silk worms and cocoons.

Mr. Hallidie is already putting up in the Pavilion a wire sash cord machine, for making sash-cord for windows.

Capt. Cox will also exhibit one of his machines for working cement gravel.

The restaurant privilege has been sold to Nick Mathiesen, a caterer of considerable reputation, who announces that he will fit up splendid accommodations.

MULTIPLICATION EXTRAORDINARY.—Two hundred and forty cocoons of the best quality weigh about one pound. Suppose one-half of these to contain females; there will then be one hundred and twenty. Each of these will deposit, say, five hundred eggs; we have then sixty thousand eggs. If these eggs all produce worms, and those worms all make their cocoons, we have, as the year's result from the single pound, *two hundred and fifty pounds* of cocoons. The calculation for the second year, made from the same data, shows a yield for that year, of 62,500 pounds,—or thirty-one and a quarter tons! Suppose each pound produces, for the next year, an ounce of eggs,—for a few thousand either way will make but little difference, and we will be reasonable,—we have 62,500 ounces of eggs as the product of the third year. These eggs, at only $5 an ounce, are worth in the market $300,000,—knocking off the odd thousands here as before;—a very tolerable three years' profit on the outlay. Perhaps it would be as well, however, for those of our readers who may become excited by the above figures, *to hatch their first crop*, at least, before counting the rest.

PROSPERITY OF SAN FRANCISCO.—We do not know of a better evidence of the prosperity which exists among the masses of this city, than is afforded by the regular exhibits of our saving societies. Probably no city in the world can produce so favorable a record in this particular as San Francisco. In a population of not much over 130,000, our saving institutions at the present time exhibit a volume of $20,000,000 of gold. Three years ago the amount was less than $7,000,000; it has increased $3,000,000 within the last six months. The increase of the past year has been at a time when there has been a most unusual activity in the purchase of homesteads among the laboring class of people. These homestead associations are themselves nothing more or less than saving institutions, where the purchaser lays by ten, fifteen or twenty dollars per month, as he may be able, to purchase a lot on which to build a house of his own. There is no other city in the world where so large a proportion of its population own their own homes, as this; and that proportion is constantly increasing in magnitude. The usefulness to the masses of saving institutions is nowhere so apparent as in San Francisco, and it is with pleasure we observe that a movement has already been made to secure their establishment in the interior towns. The facilities which they offer to persons of small means to employ their savings at reasonable rates and with sure returns, cannot be equaled by any other mode of investment.

THE CHINESE MISSION.—We had the pleasure of a call, on Thursday, from Hon. J. Ross Browne, Minister to China, and Col. C. D. Poston, formerly of Arizona, but late of Washington, who accompanies the embassy as Commissioner of Agriculture. They leave on the steamer of Monday. We yesterday learned that Baron Richthofen, will also accompany the mission in the character of geologist. The object of his mission will be a thorough and scientific examination into the mineral resources of China. The importance and propriety of such a commission did not become apparent until it was too late to secure a salaried appointment from Washington. To meet this emergency a number of wealthy gentlemen of this city have raised the means necessary to defray the expenses of the Commission, and he will sail with Messrs. Browne and Poston on Monday.

"OVERLAND MONTHLY" FOR AUGUST.—The publishers have laid a copy of this magazine upon our table. It fully sustains the promise of the opening number. Almost everybody will find in it something worth reading. The pioneer will be interested in "A Day with the Cow-Column;" the traveler in "Scalping as a Fine Art;" and art-lovers in No. 2 of "Art-Beginnings on the Pacific." Various other articles with attractive titles appear in the Table of Contents; but the late hour forbids us at this moment further to make examination. The publication is a credit to our city and State; and we trust it will be generally supported.

SCHOOL OF MINING AT CAMBRIDGE.—By reference to advertisement in another column, it will be noticed that the course of instruction in the Department of Mining and Practical Geology, of Harvard University, will be continued on an enlarged scale during the approaching collegiate year. This department is now under the immediate charge of Prof. J. D. Whitney, late of the California Geological Survey.

TICKETS for the Mechanics' Fair are now for sale at the bookstores and by members of the Board of Managers. Price of season ticket for single person, $3; for gentleman and lady, $5; childrens' season ticket, $1.50; single admission, 50 cents; children, 25 cents. The Managers announce that they have received encouragement beyond their expectations, and anticipate the most successful exhibition ever held in this city.

Colorado Ores.

The Colorado *Mining Journal* of recent date says, that as the overland railroad is approaching that neighborhood, much interest is beginning to be felt with regard to the practicability of sending the richer ores of that district to the East, for treatment, instead of paying the large prices that are charged at the reduction works in Colorado. The railroad offers to take ores from Cheyenne to Newark, New Jersey, (where extensive reduction works have been built) for $39 per ton. With a branch railroad from that point to the mines, but a small additional tax only would have to be added for their through transit. Ores are reduced at the Newark Smelting and Reduction Works, as per card of proprietors, as follows:

ARGENTIFEROUS LEAD ORES.

Above 55 per cent. lead	$35.00 Currency.
Below 55 per cent. lead	40.00 Currency.
Silver or gold ores	80.00 Gold.
Sulphurets (per ton of 2,000 pounds)	60.00 Gold.

Ninety-nine per cent. of the assay value of the precious metals will be delivered. Loss on lead from 12 to 15 per cent.

It will be seen from the above figures that the cost of treatment of sulphurets is much higher than the cost in this State. The process employed at Newark is not given. We infer, however, that it is by chlorination. The guarantee of ninety-nine per cent., however, is impracticable, and cannot be done on a working scale at any price. Colorado no doubt contains large quantities of very rich ores, yielding from $200 to $500 and over, per ton, nearly all of which requires careful treatment. These ores can be mined for from $5 to $20 per ton, and the time will soon come when they can be transported to the East for from $40 to $50 per ton. When that time arrives, the overland railroad will do a large amount of that class of transportation, or the owners of reduction works in Colorado must greatly reduce their present rates. The same remarks will hold good throughout much of the State of Nevada. The completion of the railroad will, in one way or the other, give a most wonderful impetus to the development of the mines throughout the entire region of country, from the Black Hills to the Sierra Nevada.

COX'S CEMENT MACHINE.—Many of our readers, who have never seen this machine, will be pleased to learn that one of them will be exhibited at the Fair, where all who visit the city, during the coming month, will have ample opportunity to examine its construction, and witness its mode of operation. The economy of its use in working cemented gravel has now been fully established. One of these machines has been employed for a long time by Mr. Allen Oliver, at Jamestown, in Tuolumne County. It is now at work upon cement tailings, from gravel which has been run through sluices. Fifty tons of these tailings are put through the machine every twelve hours, from which two dollars per ton is obtained at a cost of the labor of one man. But a small quantity of water is used, and that at a cost of only five cents an inch. There are untold millions of tons of such tailings in the State, which would pay all the way from twenty cents to two dollars and upward per ton. Even at the former rate, such tailings will afford a good business.

Mr. D. T. Hughes, formerly an assayer of this city, is running one of these machines near the same locality, but upon gravel as it is taken from the mine. He is putting through nearly as much gravel as Mr. Oliver. From what we can learn of the success which attends the working of this machine, we think it is something well worth the attention of our cement miners.

THE TRACK-LAYER.—We learn from our Washington agent, that a patent has been allowed to Mr. Robertson, for his track-laying machine.

The Steam Plow at the Fair.

We are authorized by the Board of Managers of the Sixth Industrial Exhibition, to state that the steam plow invented by Coffin & Standish, of Martinez, will be placed on exhibition during the early days of the approaching Fair. As it will probably remain in this city only about one week, on account of pending engagements at Stockton, farmers and others from the northern and central portions of the State, especially those who wish to see and examine this important and valuable California invention, will do well to make their visit to the city and Fair during the first week of the Exhibition. Practical exhibitions of the working of the plow will be given, daily, if deemed expedient, in the open portion of the square adjoining the Pavilion.

The plow will be brought to the city from Martinez, on a deck lighter, in tow of a steamer, and will arrive here early the ensuing week. The proprietors will give a practical demonstration of its locomotive capacity by allowing it to work its own way up to the Pavilion from the point of landing, if the proper authorities will grant the privilege, which, by all means, should be done.

This is regarded by those who have carefully examined into its merits as one of the most valuable inventions of the day, and one which promises to save millions of dollars to this State alone. A large amount of money has already been expended in the necessary experimental trials toward bringing it to its present state of perfection; and it is due to the enterprise and energy of Capt. O. C. Coffin, who has invested nearly all his ready means in the enterprise, and to the mechanical skill, ingenuity and perseverance of Mr. P. H. Standish, the inventor, that California will be able, at the coming Fair, to exhibit to the world an invention which bids fair to work a complete revolution in that most useful instrument, the plow; which, until now, has remained, in all its essential principles, almost precisely the same instrument which has been used from the earliest times of recorded history.

All who feel an interest in such an invention should embrace the present opportunity to examine and judge for themselves of its practical merits. The present machine, as we have already intimated, has been constructed without reference to weight or compactness, merely to demonstrate the practicability of the principle. We are pleased to learn, however, that three or four permits to build the plow have already been sold to parties in this State, for a royalty of $1,000 each, so that the invention will soon be put to a thorough test in the field. The inventors have determined to sell rights for all the different States, with the exception of California and Illinois, which two States they have reserved for themselves.

Mining Sales in Placer County.—We learn that the Walton gold mines and property near Ophir, in Placer county, has recently been sold, through the agency of Capt. Holdredge, of this city, for the sum of $20,000. It was purchased by parties in this city. The Green Emigrant has also been sold for $15,000 to C. T. Fay. Both of these mines were sold at less than their estimated value. The Captain has now for sale the famous Black ledge, in the same vicinity.

Water on the Desert.—Parties employed by the Pacific Railroad in boring on the desert to the east of the Truckee, have struck water strongly impregnated with sulphur and salt. It is fresh water that they are in search of, and the simple fact that they find any water at all, within a reasonable depth, is an encouragement to persevere until they get such as they want.

Wanted—At this office, the postoffice address of Enraght Mussey, late of Gold Hill, Nevada.

It is estimated that fully 50,000 people come into Boston daily, by the various railroad and car routes, for the transaction of business.

Notice.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-ainn

---

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Paint will not remove in five minutes. Whether a frightful Burn, a grinding Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.

G. H. MOORE, Inventor and Sole Proprietor, 632 Market street, San Francisco, Cal. 21v16-3m

---

Save Your Teeth.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

☞TO THE PUBLIC.☜

Hear what Bussey has got to say in defence of his Lock:

Whereas, Certain parties in San Francisco and elsewhere, are conniving to destroy the reputation of the Bussey Lock, in order to establish other Locks in which they are interested; and

Whereas, It is asserted that a certain individual now in this city will put up $5,000 against the same amount, that he can pick the Bussey Lock in eight hours' time; but makes Bussey this generous proposition: That he does not wish to injure him in any way, and if he will pay a certain amount of money the Lock will not be exposed. Wants Money, is in the market at the highest bidder!

Now Bussey wishes it distinctly understood that he pays no man to keep quiet. Bussey's Improved Combination Lock will be on exhibition at the Mechanics' Fair, in competition with other Locks for the First Premium, and a challenge will be given then and there, to the world in general, and H. S. Folger in particular. The security of the Lock will be endorsed in any amount, from $500 to $50,000. The man presuming to pick it will be required to endorse his skill in a corresponding amount.

PRACTICAL GEOLOGY

OF HARVARD UNIVERSITY.

The course of instruction in the department of Mining and Practical Geology of Harvard University, will be continued, on an enlarged scale, during the collegiate year 1868-9. The examination for admission will be held on THURSDAY and FRIDAY, September 17th and 18th.

For further information and for Circulars, apply to

PROF. J. D. WHITNEY,
Dean of the Faculty.

Cambridge, Mass., July 3, 1868. 5v17-1m

SAN FRANCISCO

Pioneer Screen Works,

JOHN W. QUICK, Manufacturer,

Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.

Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.

N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the Mechanics' Institute Fair, will please call and see me. 5v17-1y

SPECIALTIES.

PRICE AND GUARANTEE.

The largest and most varied stock of Gentlemen's Clothing, Furnishing Goods, Trunks, Sacs and Valises, on the Pacific Coast. Every article sold, being of our own manufacture, is guaranteed. Having contracts direct with European and American manufacturers of piece goods, we thereby effect a saving of fully 50 per cent. in wholesale dealers' profits, and are thus able to offer superior goods at less than second-rate prices.

STYLES.

Having agents in London and Paris, we introduce the new styles in San Francisco simultaneously with their appearance in New York.

GOODS MADE TO ORDER.

For the accommodation of such as may desire, we have secured the services of a celebrated European cutter, and are prepared to make up piece goods in a style superior to any other house on the coast. Shirts, Ties, Collars, etc., made to order at short notice.

COUNTRY ORDERS.

Goods forwarded by Express to any part of the Pacific Coast on receipt of orders and measures; send for directions for measurement.

Cyanide of Potassium.

Messrs. Falkenau & Hanks—Gentlemen:—I have, in the last year's experience in milling gold ores, had occasion to examine, with care, the effects of the Cyanide of Potassium in promoting amalgamation. I am bound to say, as the result of my observations and experience, that it is a most powerful agent in amalgamation. With its aid and that of a little sodium and amalgam, copper plates are immediately mercurialized with ease and certainty, and the effects of nitric acid entirely avoided. The solvent power of Cyanide of Potassium on metallic oxides is well known to chemists, and its effects in brightening the dull surface of unhealthy coppers in mill sluices is something wonderful to witness. Opinions are divided among amalgamators as to the durability of this effect, as compared with the ordinary mode of treatment by the brush, etc.; but my own judgment points clearly to the remarkable power as being a subject well worthy of the careful and candid examination of all who have an interest in the management of gold quartz mines. Of its efficiency and usefulness in pan workings no one, I believe, entertains a doubt.

Yours truly, PROF. B. SILLIMAN.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, - - - - Potrero, San Francisco.

JOS. POWNING, Sec'y. JAS. EVA, Supt.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

GODDARD & CO.

To Inventors.

The undersigned is now prepared to assist inventors or others by manufacturing Models for the Patent Office, large working Machines or Devices of every description, in Metal or Wood, in the most workmanlike manner and at reasonable rates. Also, Patterns for Iron and Brass Work and all kinds of Machinery.

Having had ten years practical experience in this city, parties can be assured all work entrusted to me will be executed in a prompt and satisfactory manner. Power will be granted to parties wishing to test or experiment with machinery.

☞Full files of the Patent Office Reports for the use of patrons. J. H. CULVER,

Fire and Water.

These two elements, when brought together, work great wonders. They do far more than drive steamers and locomotives. It is through their reciprocal action that human life is kept up.

The boiling-point of water is 212 degrees of Fahrenheit, at which temperature the expansive power of the steam exactly balances the pressure of the atmosphere. The barometer shows that the atmospheric pressure varies, and so the boiling point of water will not be constant; the higher the mercury the heavier the air, and therefore the hotter our boiling water. On the other hand, if we go picnicing up a mountain, and wish to take refreshment at a hight where there is considerably less air above us, we may boil eggs and make tea, but the eggs will not be done, and the tea will not be good, for the water, though boiling, will not be as hot as boiling water at a lower level.

Liquids do not get any hotter after they begin to boil, however long or with whatever violence the boiling is continued. The fact is of importance in domestic economy, particularly in cookery, and attention to it would save much fuel. Soups made to boil in a gentle way by the application of a moderate heat, are just as hot as when they are made to boil on a strong fire with the greatest violence. Again, when water in a copper is once brought to the boiling point, the fire may be reduced, as having no further effect in raising its temperature.

If steam be confined in an iron boiler or other vessel, it may be made intensely hot, and so expanded as to burst any contrivance known to man. It will thus dissolve bones and other substances.

Where the steam is not confined, as in an ordinary kettle, it is of the same temperature as the water (212 degrees) and all the additional heat applied to the water goes simply to make a larger quantity of steam. A given volume of water—a quart, let us say—when it changes into steam, occupies a space 1,694 times greater that it does when liquid. In seeking to take up this extra space, it exerts tremendous force, pushing before it the mighty steam engine, or in a smaller way lifting the lid from the kettle. But the extra bulk of steam, as compared with water, is only gained by its taking up a large quantity of heat; the steam, indeed, is no hotter than the water, but it contains the heat in a latent form—wrapped up, stowed away, as it were. When the steam is reconverted into water, exactly the same amount of heat is given out again.

NEW USES OF ELECTRO-MAGNETISM.—There are many who look forward to a time when electro-megnetism will supersede steam as a motive-power. It is quite possible that electricity may be employed as a motive force, but the amount of mechanical work which it is capable of doing is comparatively small, and in the present state of knowledge, it is enormously expensive. There are circumstances, however, in which cost is a matter of small consideration, and in these electricity may sometimes be turned to useful account. A lady may wish for a sewing machine, but the labor of driving it is more than she can exert. For such, M. Cazal has invented an electro-magnetic machine which we have no doubt will be competent to do the work with light fabrics. The details of this machine we must defer until a more complete account than we have yet met with comes to hand. For ornamentation, too, electricity is coming into use. You may see at a fashionable ball at Paris a lady on the top of whose head sits a butterfly or humming-bird. The fly and the bird flutter their wings in the most natural way possible. How is it managed? Why, within the chignon are concealed a small battery and a minute Rhumkorff coil. On the bosom of another may be a brooch, with a head upon it, the eyes of which turn in all directions. This, too, is accomplished by the use of a battery and coil so minute as to be concealed within the brooch itself. These, and more useful things, small batteries for curative purposes, easily carried about the person, are the inventions of M. Trouvé. The batteries of zinc excited by solution of sulphate of mercury are inclosed in vulcanite cells, so that the exciting solution cannot escape to the damage of the wearer.

SOME suppose that every learned man is an educated man. No such thing. The man is educated who knows himself, and takes accurate common sense views of men and things around him. Some very learned men are the greatest fools in the world; the reason is they are not educated men. Learning is only the means, not the end; its value consists in giving the means of acquiring the use of that which, properly managed, enlightens the mind.

Copper Mining on the Rhine.

THE WET PROCESS FOR POOR ORES.

Luiz, a town on the Rhine, near Godesberg, is a mining town with a history running back a thousand years. This town has been for the last two centuries the center of the copper, lead, and bleude trade of the district; and about a mile up the valley stands the old smelting works in which Herr Rhodius, the father of the present proprietor, invented and patented the "wet process" for the reduction of poor copper by means of sulphuric and muriatic acids, which, although known to many, might be much more generally and successfully practiced elsewhere, as by it ores containing 1 per cent. are profitably worked in Rhineland, the Hartz Mountains, and elsewhere in Germany. The process may be briefly described as follows:

The poor sulphides and the poor oxides, only, are worked by the wet or acid processes, the richer ores are all smelted by the old process. First, the poor sulphides, from ¾ to 3¼ per cent., are roasted in a cupola furnace, about ten by three feet, charged with alternate layers of ore and fuel, and when drawn from the bottom and freed from sulphur are crushed, thrown into a masonwork basin, about twenty feet long by five feet deep, having a false bottom of horizontal layers of basalt, supported by basalt pillars, about one foot high. Blende, slightly roasted and crushed, is placed on the hearth of a retort furnace, and raised to a high heat; air is forced into the retort, to furnish oxygen to convert the sulphur in the blende into sulphurous acid gas; this, passing through the chimney, enters the vats beneath the crushed ore, mixed on its way with steam from a boiler, and passing through the apparatus between the horizontal basalt, penetrates the mass of crushed ore, and coming in contact with the oxides of copper and other metals formed from the sulphides by roasting, the oxygen is absorbed and soluble sulphates are produced, and fall in solution to the bottom of the vats. From this the fluid is pumped whilst hot into wooden tanks built firmly in clay, containing scrap and cast iron, and the copper precipitated as cement copper, containing 35 to 40 per cent. of metal, the iron going into solution in its stead. The zinc blende left in the retorts is utilized; the liquor remaining is concentrated by being passed into shallow receivers, and crystallized sulphate of iron (copperas) obtained. The mother liquor has a still further use.

The *poor oxides*, principally malachite or blue carbonate, which look so rich, and so often deceive, contain only on an average one to two per cent. of copper, which is extracted by muriatic acid. The ores are broken, placed in large vats, and weak muriatic acid poured over the mineral, which is allowed to remain subject to its action ten days. The carbonates are converted into chlorides, and precipitated as before described. The minerals in Prussia are the exclusive property of the Crown; the royalty is two per cent. on the produce. The responsible officers of the State report periodically on the mines; the report is public property. Frauds are thus avoided in statements affecting working prospects and in returns,—advantages which cannot be over estimated by foreign and distant shareholders—indeed, by all interested in mining industry.

HOT AIR FOR CUTTING GLASS.—According to *Les Mondes* the use of hot air or gas for cutting glass is a new and useful invention already utilized by the Crystal Company of Balcarat. The hot gas issues from a pointed or flattened tube, and is driven directly upon the gohlet or other object to be cut, which is placed in close proximity to the tube and made to revolve upon its axis. A narrow circle of heated glass is thus formed upon the object in question, which, being dampened immediately afterwards, causes the glass to divide with extreme neatness at the part thus heated. The operation is more rapid and effectual, we are told, than any means hitherto employed for this purpose.

SAN FRANCISCO
HYGEIAN HOME WATER CURE.
No. 637 California street, opposite St. Mary's Cathedral.
WE HAVE NOW THE MOST EXTENSIVE AND COMplete Health Institute on the Pacific Coast, both for ladies and gentlemen. The success which has attended industry and an honest persuance of this rational mode of curing the sick for the past ten years, has enabled Dr. Smith to establish a Home combining all the hygienic appliances essential to the invalid. Owing to our increased facilities, we feel warranted in reducing the prices for gentlemen to $30 per month; to ladies from $15 to $20 per week for board and treatment.
PARLOW J. SMITH, M. D.,
Physician and Surgeon.
H. C. Co. GROVE, Superintendent. 21v16-3m

QUARTZ MILL SCREENS.—The value of good ones and the annoyance attending the use of bad ones, every man who has ever superintended the running of a quartz mill, or who has had charge of the batteries or the amalgamating rooms, or paid screen bills, can vouch for. With the one you can do good work—make every movement count, which is money in a quartz mill, and be to slight expense for screens—while with the other, you can but do bad work, and will lose not only time, but more or less of the precious metals, and money besides, and not unfrequently your *temper*. A mechanic, who devotes his whole time and attention to this one branch of manufacture, and whose reputation and success in his business depend upon his ability to compete rather more than favorably with others, ought at least to be able to make a better article, at the same or little less price, than a company, who make this but a small item in the list of their manufactures. We would recommend Mr. John W. Quick, the pioneer screen-maker of SAN FRANCISCO, and his screens, to the favorable consideration of quartz mill men. Parties visiting the Fair, would do well to call on Mr. Quick.

A TREATISE

—ON—

CONCENTRATION

OF ALL KINDS OF ORES;

INCLUDING THE

CHLORINATION PROCESS

For Gold-Bearing Sulphurets, Arseolorets, and Gold and Silver Ores Generally.

BY GUIDO KUSTEL,

Mining Engineer and Metallurgist, Author of "Nevada and California Processes of Silver and Gold Extraction."

With 120 Diagrams on 7 Plates.

CONTENTS:

I.—INTRODUCTION.

1. *The Dressing.*—Dressing of Ores; Principles of Dressing; Division of Dressing.

2. *The Separation.*—Separation of Gangue from Ore in the Mine; Dressing of Ores outside the Mine; Separation by Hammers; The Ragging; The Spalling; The Cobbing; Separation by Hand; The Picking.

3. *Cleansing and Sizing Contrivances.*—Washing and Sizing; Stationary Apparatus; The Sluice; The Kiln; The Step Sluice; Movable Machines; The Hand Riddle; The Rocker; The Circular Hand Riddle; Swinging and Jarring Riddles; The Jarring Riddle.

4. *Rotary Sizers.*—The Trommel or Drum; Cylindric Trommel; Prismatic Trommel; Conical Trommel; Combined Trommel; The Sifting Wheel; Sizes of Grains for Jigging.

II.—REDUCTION.

1. *Reduction of Ores.*—Reduction of Ores to a Proper Size; Breaking under Heavy Stamps; Reduction by Rock Breakers; Hunscom's Crusher; Blake's Quartz Breaker; Reduction by Stamps.

2. *Description of Batteries.*—The Foundation; Mortar Blocks; Frames; Iron Frames; Howland's Rotary Battery; The Straight Iron Battery; Brynat's Battery; Wright's Iron Battery.

3. *Details of a Battery.*—The Mortar; Stem or Lifter; Shoo or Pestle; Socket or Head; Tappet; Californaia Tappet; Cums—Wooden Cams; Iron Cams.

4. *Speed, Curve and Order of Lifts.*—Limit of Speed in Crushing; Construction of the Cam Curve; Order of Successive Stamp Lifts; Hunging-up of Stamps.

5. *The Discharge of Batteries.*—The Discharge in Dry Crushing—with Grates; without Grutes; with Sieves; Dust Chambers; The Discharge in Wet Crushing—the Grates and Screens.

6. *Feeding of Batteries.*—Hand-Feeding; Stationnry Hoppers; Movablo Hoppers; Quantity of Water for Crushing; Remarks on Speed and Weight of Stamps.

7. *Reduction by Rolling Mills.*—Construction of Rollers; The Frame; Feeding of Rollers; Remarks.

8. *Grinding.*—The Arastra or Tchama; The Edge or Chili Mill; Ball Mills; Lundgren's Pulverizer; Cylinder Mills; Ferraad Mill; Hopkins' Grinder; Horizontal Mills; Iron Pan Grinders.

9. *Pans with Plane Mullers.*—The Common Pan Grinders; Tub Grinder; Bartolo's Grinder; Knox's Pan; Varney's Pan; Wheeler's Pan; Union Grinder; Moore's Quartz Grinder; Gaston's Grinder.

10. *Pans with Conical Mullers.*—Hepburn & Peterson's Pan; Belden's Pan; Baux & Guiod's Grinder.

11. *Pans with Tractory-Conical Mullers.*—Excelsior Pan; Wheeler & Randall's Pan; Excelsior Continuous Grinders.

12. *Pans with Perpendicular Mullers.*—The Centrifugal Ore Griader; Varney's Quartz Griader.

III.—CONCENTRATION.

Concentration of Reduced Ore.—Division.

A. *Concentration of Ore Grains, (Jigging Stuff.)* The Principle; The Jigging.

2. *Movable Jiggers.*—The Movable Jigger.

3.—*Stationary Jiggers.*—Hydraulic Jigger; Pethcrick's Separator; Stationury Jigger.

4.—*Continual Jiggers.*—Percussion Jigger (Setz Herd); Contiaual Cylinder Jigger; Continuul Jigger; Hydraulic Continual.

5. *Rotary Machines.*—The Rotating Cylinder (Strom-setz Maschine); Rotating Wheel (Setz-Rud); The Dolly Tub; Aufcrman's Dry Jigger.

B. *Concentration of Ore Sands and Slimes*

6. *Assorting of Sands.*—The Labyrinth; Borlace's Slimo Separator; Ph. Hofmann's Separator; Rittinger's Funnel or Pointed Box; Rittinger's Spitz-Lutte.

7. *Feeding of Concentrator.*—Feeding Boxes; Stationary Feed-Box; Rotating Feeder.

8. *Stationary Concentrators.*—Hand Buddle; Sleeping Table; Rack; Sweeping Tables; Rouud Buddle; Concavo Buddle; Blanket Tables.

9. *Percussion Tables.*—Percussion Tables; German Percussion Tablo; Continual Percussion Table; Hunter's Continuul Percussion Table; Varney's Percussion Buddle.

10. *Oscillating and Shaking Tables.*—Borlace's Concentrator; Hendy's Concentrator; Hungerford's Concentrator; Barron's Concentrator.

11. *Steady Moving Concentrators.*—Steady Moving Concentrators; Concave Rotary Buddle; Convex Rotary Buddle; Burton's Table; Self-Discharging Blankets; Horizontal Moving Blanket.

IV.—SPECIAL CONCENTRATION.

1. *Concentration of Gold Ores.*—Concentration of Gold Ores; Amalgam of Gold Quartz; Amalgamation and Grinding; Combined Concentration and Amalgamation; Treatment of Concentrated Stuff.

2. *Concentration of Silver Ores.*—Concentration of Silver Ores; Concentration Works; Cost of Concentration; Concentration of Tailings.

3. *Concentration of Lead and other Ores.*—Concentration of Lead, Copper and other Ores; Vuluo of Ores for Concentration.

V.—CHLORINATION.

Extraction of Gold from Sulphurets or Arsenicals by Chloriaation; Assay of Gold Sulphurets by Chlorination; Chlorination Process for Sulphurets; Loss of Gold in Roasting; Single Roasting Furnaces; Double Furnaces; Mechanical Furnaces; The Roasting Operation; Roasting with Salt.

Chlorination.—Damping of the Roasted Ore; Sifting; Production of Chlorine Gas; Lixiviation; The Precipitating Vat; The Precipitation; Cost of the Chlorination Process per ton of Ore; Remarks.

Other Methods of Dissolving and Precipitating the Gold from Sulphurets.—Chlorination at Reichenstein; Chlorination at Schemnitz; Calvert's Method for Auriferous Quartz; Extraction of Gold, Silver and Copper.

TRANSPORTING MEAT.—A refrigerating car, constructed on a new principle, recently patented, loaded at Chicago on the 14th of June, with the meat of animals killed on the previous day, arrived in Boston on the 19th, and was opened on Monday, the 22d. The meat was found to be in as good state of preservation as that usually brought into market from Brighton and Cambridge. It is stated that meat preserved and transported in this manner, can be sold at an exceedingly low rate.

MORE STEEL RAILS.—The Camden and Amboy Company have ordered a thousand tons of steel rails, from Sheffield, Eag., which they are now receiving.

New Mining Advertisements.

Bear River Mining Company, Nevada County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the tenth day of June, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No Certificate.	No. shares.	Amount.
A G Flor	1	50	$50 00
Wesley Henderson	2	50	50 00
W F Siringer	3	50	50 00
H McCormick	not issued	662	662 00
C Jones	not issued	662	662 00

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of June, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, on the seventeenth day of August, 1868, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, Room 87 New Merchants' Exchange, California street, San Francisco. aul

Office of the Folsom Street and Fort Point Railroad and Tunnel Company, southwest corner of Montgomery and California streets, Room No. 16, San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of July, 1868, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to Caleb T. Fay, Esq., at the office of the Company.

Any shares of stock upon which said assessment shall remain unpaid on the twenty-ninth day of August, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourteenth day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

aul JOS. M WOOD, Secretary.

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of July, 1868, an assessment (No. 25) of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 533 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Thursday, the tenth day of September, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth (5th) day of October, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 533 Kearny street, corner of Sacramento, San Francisco, California. Office hours from 12 to 2 P. M. nul

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration which they may desire made in their advertisements at their earliest convenience. New advertisements should be handed in as early as possible.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL, are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumferenco as before. Thus it is constantly passing in a regular bow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the samo principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles aro rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDERY,**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petrolcum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petrolcum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... **$600**

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... **850**

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... **1,200**

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Carbolic Acid.

One of the most noteworthy features connected with the industry of the present time, is the extent to which organic chemistry has of late years contributed not only to changes in various processes of manufacture, but also to the production of new materials capable of widely extended and very frequently of widely diversified uses; and among which there are few examples of greater interest than the substance commonly known as carbolic or phenic acid, the chemical composition of which is represented by the formula, $C^{12} H^5 . O, HO$, or that of hydrous oxide of methyl. The process of obtaining the material may be described, in brief, as resulting from the distillation of the tar of bituminous matter, from which, at a temperature between 300° and 400° of Fahrenheit's thermometer, light essential oils are expelled. These latter, being collected upon the water in the condenser of the distilling apparatus, are agitated with about twice their volume of caustic potash. The combination of the acid with the alkali forms a phenate of potash, which, being treated with muriatic acid, a new salt is formed and the phenic acid is liberated; the acid, when thus obtained, constitutes a colorless oil heavier than water and closely resembling creosote, in the place of which it may be employed in some cases, inasmuch as it possesses to a certain extent some of the properties thereof.

Among the uses to which it has been proposed to apply the material under consideration, that of the greatest practical importance is doubtless the preservation of organic matter, not alone in providing for the incorruptibility of timber, for which its property of neutralizing the fermentation of albuminous compounds renders it especially well fitted, but also in preventing the decay of animal matter; its employment having been suggested for embalming, so that, if successful in such case, the cheap product of the pitchy tar will accomplish the same results for which caravans in ancient days bore across the deserts the costly spices of the farther East, an illustration that may be properly used to symbolize the difference between the arts of the old times and those of the present. Carbolic acid has furthermore another use more properly termed industrial in its nature, and involving in its employment a change in the material itself, the latter being treated with nitric acid to produce the substance known as carbazotic acid, employed to a great extent in dyeing. There may also be mentioned among its minor uses its application to the tanning extracts employed in calico-printing to prevent their decomposition and conversion by fermentation into sugar and gallic acid, and its use as a sanitary agent in preventing the decay of organic matter and the consequent noisome exhalations therefrom.

It has also been found an antidote for the toothache, doubtless acting as a counter-irritant in the same manner as creosote, and its use has been suggested as a remedy for burns and scalds in a preparation consisting of one part of the acid to thirty parts of oil and lime-water, the emulsion being spread upon a linen rag for application to to the injured part. When it is further said that it has been employed with success for the destruction of insects, and has been proposed as a substitute for oil on stones for sharpening tools, some idea may be formed of the variety of uses, great and little, to which it is applicable, and the hope be encouraged that its capabilities may be still further extended by future experience and experiment.—*American Artisan.*

THE TERM "TELEGRAM."—When the Indian term "telegram" was first applied to our telegraph messages, a considerable amount of learned disquisition was wasted in seeking its origin. Any one who has been in India must remember the curious pronunciation by natives of many English proper names, as well of other words, for which they have no translation in Hindoostanee; generally abbreviating a long, difficult expression, and sometimes even changing altogether the pronunciation. On the introduction of the telegraph into India, there being no Hindoo word, the natives were obliged to attempt English, and the easiest way they could manage to pronounce "telegraphic message," was "telegram." This being an easy abbreviation it was at once picked up and adopted by the English in India, and then came home in the same way that we got "loot" from India, and now again from China.—*The Engineer.*

A NOVEL USE OF STEAM.—Somebody in Louisiana proposes the use of steam directly through the share of a steam plow, to loosen the soil.

MOTION OF THE EYE.—On coming into a room we think we see the whole side of it at once—the pictures, the cornice, the chairs—but we are deceived; being unconscious of the motions of the eye, and that each object is rapidly, but successively, presented to it. It is easy to show that if the eye were steady, vision would be quickly lost; that all those objects which are distinct and brilliant are so from the motion of the eye; that they would disappear were it otherwise. For example, let us fix the eye on one point—a difficult thing to do, owing to the very disposition to motion in the eye. When we have done so, we shall find that the whole scene becomes more and more obscure, and finally vanishes. If we then change the direction of the eye but ever so little, at once the whole scene will be again perfect before us. These phenomena are consequent upon the retina being subject to exhaustion by the lights, shades and colors of objects continuing to strike upon the same relative parts, and thus exhausting the nerve; but when the eye shifts, there is a new exercise of the nerve.

SOLAR HEAT AS A MOTOR.—An English engineer proposes employing solar heat in generating steam. By using a lens of small diameter, the sun's rays have been concentrated in a vessel containing water, to such a degree that enough steam has been generated to drive a small engine. Increasing the size of the lens will, he contends, have the effect of still further intensifying the solar heat, and the power that may be obtained is only to be limited by the dimension of the apparatus employed. Should the plan of this engineer be generally adopted the old proverbial injunction for promptness will take a mechanical turn, "make steam while the sun shines," instead of its original agricultural significance.

ELM BARK is very generally used in Norway for making leather, and it is said the fine Norway gloves are prepared from the elm bark, and that the softness and beauty of the leather are attributable to this bark. The white willow is employed in Denmark for the leather used in the manufacture of gloves. Russia also uses this bark in the manufacture of fancy leather, the finished leather being impregnated with the oil of birch bark, which gives it a peculiar, agreeable smell. It is a noteworthy fact that the Norway tanners use birch and willow in preference to oak bark.

PREPARING FEATHERS FOR BEDS AND PILLOWS.—At the plucking of the birds all the coarse feathers are separated from the fine, the latter being put into large calico bags, which bags are put into a brick oven when it has sufficiently cooled after baking not to burn the bags, and there they remain until next baking day, and so on week after week until sufficiently seasoned. The heat entirely destroys all animal and oily matter.

THE LOCUST FOR POSTS.—Clark Smith, of Sayville, L. I., says that forty years experience in setting fences with locust posts has convinced him that no others are worth using when this timber can be obtained. Split locust posts well seasoned, which he put in forty years ago, are sound now, while round post set green will rot in fifteen years.

THE new hotels in London are copied after the latest American houses in the large cities.

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is Invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

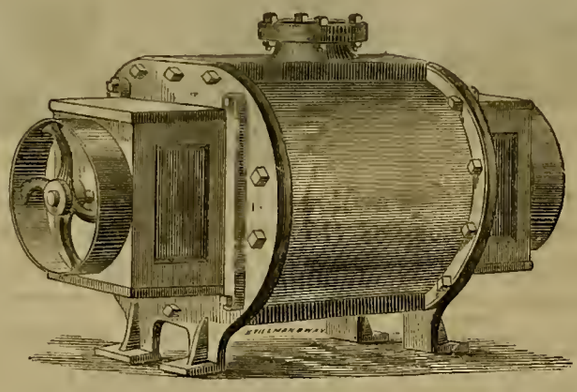
THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

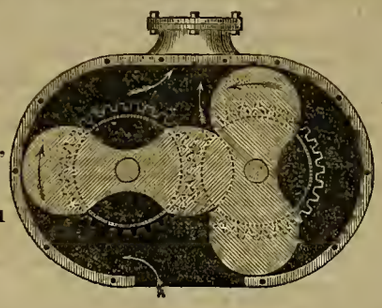
N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address



J. E. BUERK, Proprietor,
47 Congress street, Boston.

P. O. Box, No. 1057. 23v16-6m



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER! Than any Blower now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

4v16:m

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

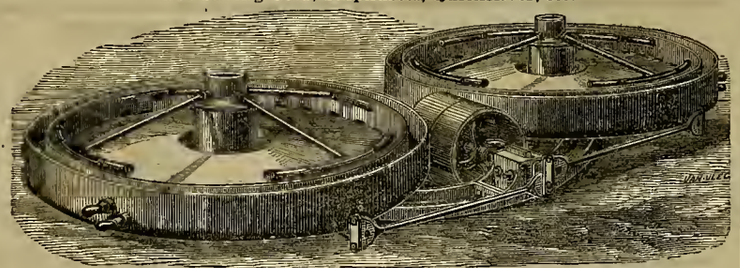


FIG. 1.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

Fig. 1 is a perspective view of that pan as now constructed. For economy of space and machinery, one shaft is made to drive two pans, which are set and arranged as shown in the engraving.

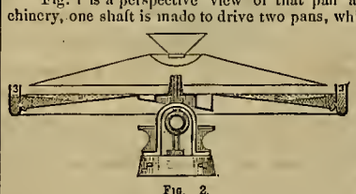

FIG. 2.

Fig 2 is a section through the center of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

RECOMMENDATIONS:

NEWCASTLE, Cal., June 21, 1868.

M. HUNGERFORD, ESQ.—*Dear Sir:*—Having used eight of your improved Concentrators (built by Goss & Lambard, of Sacramento), it affords me pleasure to bear testimony to their efficiency and adaptation to the purposes for which they are designed. I have used various styles of Concentrators during the last five years, but have found nothing that begins to compare with your machine, for durability and thorough concentration; and I can confidently recommend them to millmen, being, in my opinion, the best Concentrator now in use. Yours truly, J. C. COREY.

NEWCASTLE, Placer County, Cal., June 23, 1868.

Mr. MORGAN HUNGERFORD, ESQ.—*Dear Sir:*—After witnessing the operation of eight of your Concentrators for a month, in the Golden Rule mill, Placer County, and running the same number in the Mt. Pleasant mill, El Dorado County, I am satisfied they are superior, as Concentrators, and more durable and less liable to get out of order, than any Concentraters I have seen; and I recommend them to millmen, feeling assured they will, after the most thorough trial, be pleased with them.

Very respectfully, L. E. ATCHISON, Metallurgist.

BIG OAK FLAT, May 23, 1868.—*Mr. Thos. Mulford*—Dear Sir:—I have used two of Mr. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

These Pans can be seen at the Pioneer Mills, entrance on Stephenson street, San Francisco.

In future these Pans will be manufactured exclusively by GOSS & LAMBARD, of Sacramento, which is a guarantee that they will be built in the most substantial manner. Price, $300. Address, Goss & Lambard, Sacramento, or M. HUNGERFORD, San Francisco.

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to palm, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

Subscribe for the New Volume of the Mining and Scientific Press.

The proprietors of this jonrnal will nndertake to make the Seventeenth Volume of the MINING AND SCIENTIFIC PRESS (commencing July 1st 1868), superior in many respects to former issues.

It will he printed on extra quality of paper, rendering it a bandsome volume to file for futuro nse.

An increased amonnt of editorial lahor will he expended in the preparation of leading articles relating to the progress of scientific developments in various parts of tbe world; new discoveries in geology, mineralogy, metallurgy, and new processes and metbods relating to mining in all its branches.

Illnstrations will he given of apparatus for saving precious metals, and of machinery and inventions of general interest.

Each nnmber will treat carefully on snbjects of homo trades, manufactures and domestic economy

Our mining summary and weekly stock report gives the latest news from the most important mines and mining districts througbout the Pacifie States and Territories.

An official list of patent claims issued to inventors on the Pacific Coast, is puhlished in advance of all other journals.

The latest prices of stocks are qnoted; also the produce and market rates, metal market and prices of copper ores.

Our "Mining Shareholders' Directory" advises holders of meetings, assessments, dividends, sales, etc.

"Answers to Correspondents" afford much of intcrest to readers and of advantage to the community.

The Mechanical and Scientific Miscellany contained on a single page of each issue we are frequently told is worth the price of the whole paper.

Information contained in one article has been known to benefit a single subscriber an hnndred fold the cost of a year's snbscription.

The PRESS was estahlished in 1860, and as a mining and mechanical journal has met with unrivalled success.

Sample copies sent free on application.

Subscription, $5 per annum.

DEWEY & CO.,

Publishers, Patent Agents and Job Printers, corner Sansome and Clay streets, San Francisco.

BLOW-PIPE INSTRUCTION.—We have received from A. Roman & Co., a new work, comprising a system of instrnction in the practical use of the blow-pipe, by C. W. Plympton, Professor of Physical Science of the Polytechnic Institute, Brooklyn, N. Y. This work was originally compiled from the works of Scheerer and Plattner, and appears to possess many advantages as a text book, over the very few other English works extant on this important subject. We shall more carefully examine the work during the coming week and make further notice of it in onr next issue.

CALISAYA BARK.—It is said that Messrs. Drake & Co., (proprietors of the Plantation Bitters) are tho largest importers of Calisaya Bark in this country, and that, witb tbe exception of an occasional sale, that all they import is used in the compounding of their celebrated Plantation Bitters, and to which they undoubtedly are indebted for their wonderful health restoring properties. As a Tonic and Appetizer they are not surpassed, and we cbeerfully recommend tbem. All first-class druggists keep them for sale. *

HAYWARD & COLEMAN,

IMPORTERS AND REFINERS

—OF—

Illuminating, Lubricating,

—AND—

PAINT OILS,

CONSISTING OF

KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS. NEATSFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

—ALSO—

Spirits of Turpentine and Alcohol.

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

Lamps and Lamp Stock!

☞ A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial. ☜ an elegant and complete assortment on hand. ☜

Mechanics' Fair Press.

Printed daily in the Pavilion--Circulated Free to over One Hundred Thousand (100,000) Industrial People.

Having received permission from the Mechanics' Institute, we shall print tho

Third Volume of the Fair Daily Press,

in the Grand Pavilion, during tho approaching Exhibition, which opens on the 8th day of August, 1868.

Our publication of the DAILY PRESS, in the Pavilion in 1864 and 1865, met with marked success, rendering ample satisfaction to its patrons and numerous visitors attending the Fairs. We are now confident that, with improved facilities, experience, and active efforts, the present volume will he made still more attractive and useful for the increased thousands who will visit tho Exhibition, and receive, gratitously, each issuo

Fresh from the Press.

Some ONE HUNDRED THOUSAND (100,000!) industrial people will visit the Fair and receive copies of the FAIR PRESS. This is a greater number of DIFFERENT INDIVIDUALS than the combined subscriptions of any other ten papers published on the Pacific Coast. Being a NEW PAPER (which the receiver has *seen printed*) the sheet will be preserved, and its contents—both reading and advertising—appearing entirely original, will secure its thorough perusal.

New and interesting features will he adopted. Each number will contain a large amount of spriglbly local matter, together with mucb permanently valuable reading.

Hundreds of extra copies of the PRESS will he circulated throughout the country, by parties who have their inventions and business illustrated and described in our columns.

Particular attention will he given to preparing engravings, inserting advertisements in conspicuous, novel and attractive forms; we will otherwise assist advertisers in getting up tbeir notices, when desired.

A limited portion of the paper will he allotted to a choice class of advertising, furnishing a favorable opportunity such as is rarely met with. Following are our uniform

Rates of Advertising:

One column during the Fair	$260 00
One-half colnmn during the Fair	130 00
Per line (space of small type) during Fair,	2 00
Per line, 10 lines or more, during Fair	1 75
Per line, 30 lines or more, during Fair	1 50
Per line for single insertion	25

Notices of the Press:

Following are a few of the many compliments paid the provious volumes of tho DAILY FAIR PRESS:

THE SCIENTIFIC PRESS proprietors striko off and give away thousands of their little sheet, entitled THE MECHANICS' FAIR DAILY PNESS. There were great crowds all the evening about the telegraph and the presses, many of whom had their first sight at the practical working of these great motors of civilization.—*S. F. Evening Bulletin, Sept.* 7, 1864.

SCIENTIFIC PRESS.—A printing office has heen estahlished at tho Mechanics' Fair, and Messrs. DEWEY & Co., the enterprising publishers of the MINING AND SCIENTIFIC PRESS, are issuing from it a handsome double-sheet daily, which is a credit to themselves, its editors, and to tho Fair.—*S. F. Morning Call, Sept.* 8, 1864.

Parties who intend to advertiso will do well to snhscribe at onco for the amount of spaco wanted.

DEWEY & CO.,

Pnblishers of tho MINING AND SCIENTIFIC PRESS, Patent Agents, Book and Job Printers, corner of Clay and Sansome streets, San Francisco.

MANAGERS OF THE FAIR.—The list of Officers above enumerated constitute the Board of Managers of the Sixth Industrial Fair of 1868,

AMERICAN

(WALTHAM)

WATCHES,

THE BEST!

THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a

MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the Imported Watch.

At Waltham, Watches are manufactured on a large scale, under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first class dealers in the United States and British Provinces.

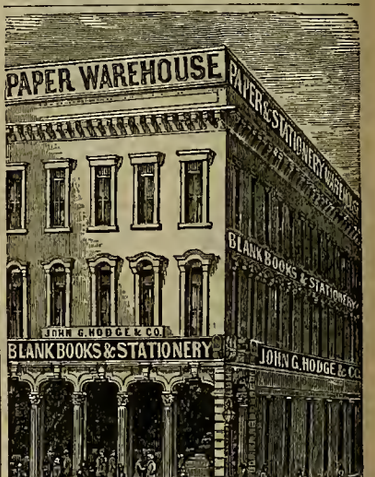
Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.



Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

REMOVAL.—The office of the MINING AND SCIENTIFIC PRESS, with the Patent Agency and Job Printing Office, connected therewith, will be removed, to-day, from its present location, 505 Clay street, to 414, on the opposite side of the same street, and about half a block lower down—just below Sansome. The object of this removal is to secure larger and more commodious rooms, and a building in which our business can all be placed together. The necessity which has heretofore existed of carrying on our patent business more than a block away from our main business office, has been a source of great inconvenience and annoyance, not only to ourselves, but to our customers as well. Our friends will hereafter find us as above.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

We have received from our old correspondent, Mr. A. J. Howk, of Ellsworth, Nevada, a box of very fine specimens, among which we notice first, a substance which he informs us "is found oozing out of clefts of limestone in that vicinity, and thought to be an animal deposit, from the fact of its association with the dens of a species of rat that lives in the crevices of the rocks, and on which account the miners have given it the name of "ratoleum." This substance is undoubtedly organic, and is probably a resinous gum derived from the roots of a resinous tree. We have numbered this 214 in our cabinet.

No. 215 is a fine specimen of tungstate of manganese, from Mammoth District, Nevada. No. 216 is a very perfect pair of twin crystals.

No. 217 is a very pretty cluster of finor spar crystals. No. 218 is a specimen of purplo copper ore from the "West Slope," Mammotb Mountain, accompanied witb green carbonate. The vein from which such a specimen was obtained, ought to be rich in copper. 219 is a sulphuret of antimony, location not given.

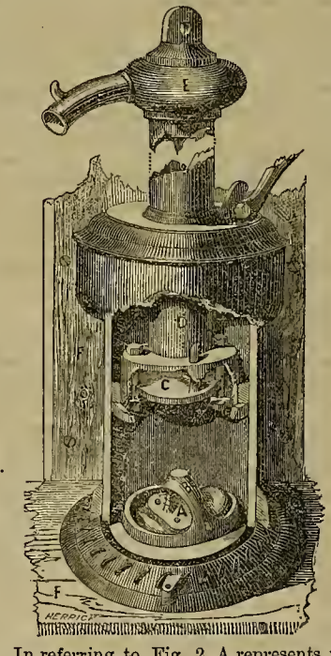
Nos. 220 to 226 consist of representative ores from the Main Summit, the St. Helena, and the Cadiz ledges, Mammoth District. Nos. 225 and 226 represent the first and second extensions of the Marble Falls Ledge. Nos. 227 to 234 inclusive, consist of a very fine suit of specimens from the Marble Falls. All the latter show free gold, and are indicative of a very valuable mine.

No. 235 is a very fine specimen of amorphous fluor spar, covered with small bluetinted cubical crystals of the same mineral. No. 236 is a very beautiful specimen of silicified wood.

Munson's California Submerged Pump.

This pump is a California invention, brought out by a practical pump-maker, who has devoted years of study and labor to its perfection. It is at once simple, cheap and effective, combining all the advantages of the common lift, with the double-acting suction and force pump, and is now offered to the public entirely on its merits. It is claimed that it can be sold as cheap or cheaper than any other, in proportion to the work it can perform with a given power. An examination of its construction will at once show its durability and economy. The water passages are large and straight, thereby avoiding unnecessary friction. It has only two valves, both of which are made of metal. It is so constructed that it can be readily emptied of its water when its operation ceases, by means of a trip-valve as described below. The pump once put in order requires no repairs, under ordinary usage; but if by accident any portion should be broken or lost, a duplicate can be had at the mere cost of the casting necessary to be replaced. The patterns are so accurately made that every part of one pump fits to any other of the same size without any machine work.

FIG. 1.



In the engraving herewith given, Fig. 1 represents a perspective view of a pump designed to act as a simple suction and force pump. At the nozzle end of the hose is seen an ingenious arrangement to take the place of the ordinary rose sprinkler. It consists of a small attachment made of brass, hinged to the nozzle, which, when grasped by the hand, may be lowered or elevated by the action of a spiral spring. The jet as it leaves the nozzle strikes upon a flat surface, sustained at a slight angle, which spreads the stream into a fan shape, more or less flattened or finely divided as the spring is elevated or depressed. When the spring is not depressed, the stream flows as from an ordinary nozzle, so that it may be operated either way at pleasure. The jet may be divided finer by this arrangement than by the finest rose sprinkler. Application for a patent for this invention is now pending.

Fig. 2, represents a sectional view of the same pump, with a portion of its walls broken away, so as to show its interior parts. This is intended to operate as a submerged lift and force-pump, and is known as the "California Submerged Pump."

The *Scientific American* of June 25th, 1864, refers to this invention as follows:

"This invention consists, first, in a novel trip-valve arrangement for admitting of the escape of water from the ednetion pipe of the pump after each operation of the same, whereby the pump is prevented from being rendered inoperative in winter by freezing, and fresh, cool water always obtained in the summer. The invention consists, secondly, in a novel construction of the plunger of the pump, whereby the former is made to serve as an air-vessel as well as a plunger, and considerable expense saved in the construction of the pump, and the latter also materially simplified. It consists, thirdly, in the use of a cap attached to the pump box at the top of the well or cistern, and provided with a brake joint, whereby a very simple, economical and durable means is obtained for a pump fixture at the top of the well or cistern."

FIG. 2.

In referring to Fig. 2, A represents the lower valve, C the upper valve, and D the plunger, which consists of a hollow pipe for the water way. B represents a metal bonnet which holds the valve A in place. The water passing through the lower valve is forced by the downward action of the plunger D upward through the same into the chamber E, and out through the goose-neck or spout. Windmill or other power may be attached direct to the top of the plunger, by an eye-bolt, as shown; or power may be applied to a brake joint, as is shown upon the top of the barrel, below the pipe and chamber E.

The public are invited to call and examine this pump, at 635 Howard street, and judge of its merits for themselves. Town agencies for its sale on application as above. State and County rights also for sale.

The State University.

We understand that the attention of the Board of State University Regents has been for several weeks called to the propriety of the appointment of a Secretary to the Board. This position of Secretary to the University, according to what we conceive to be the meaning and spirit of the Act of the Legislature, which has brought the University into existence, was contemplated to be a most important one. The programme positively directed to be pursued in establishing the University, is, first, the institution of an Agricultural College; second, one for the Mechanic Arts; third, Mining and its associate sciences, and lastly the Classics, etc. From the fact that the Legislature has made it mandatory that the Secretary "shall be a practical agriculturist by profession, and capable of managing a farm, etc., combined with the qualifications requisite to perform the ordinary duties of a Secretary, it is quite evident that the intention of inserting such conditions was for the purpose of having appointed to that office some person having special qualifications by the possession of a practical knowledge of agriculture, and as much other varied scientific knowledge as could be obtained in the person of such an officer.

We understand, however, that owing to the fact that in the present infantile position of the affairs of the University, the more important duties intended to be performed by the Secretary, are not needed, and will not be required for some months to come; that in fact the duties now required are, and will, for sometime, merely he those of a simple recording clerk; hence it is not requisite to appoint to the office a person possessing the qualifications so emphatically insisted on by the Act of the Legislature. In the cogency and appropriateness of such a course, we concur, provided only a clerk is now appointed. We should, however, demur to the appointment of any Secretary not fully qualified under the Act, for the permanent office. If the term clerk is offensive, we would suggest that the difficulty may be got over by appointing a Secretary to the Board of Regents; but whenever the Secretary to the University is to be appointed, we trust that no one but a practical and scientific man will be placed in the position; and that whenever the selection of such official is made, we hope no circumstances associated with creed, country or party will have any influence in the decision. It is quite evident that under the law, as it now exists, the judicious appointment of a Secretary will possess no inconsiderable influence in regard to the future weal or woe of our University.

D. MAOKEN, an honest subscriber to the PRESS, at Nelson Point, Plumas County, has our thanks for unusual favors.

A GRAPE fever reigns through the South, and everybody who has dipped into it is expecting to get rich.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

The Age of Gold-Bearing Rocks.

BY PROFESSOR ROWLANDSON.

Under the above heading appeared in the last week's issue of the MINING AND SCIENTIFIC PRESS, the recently modified views of Sir R. Murchison, on this interesting subject, respecting which I pnrpose appending a few observations. Previons to doing so, I wish to remind the reader that from inductive reasoning I have on theoretical grounds puhlished as my views what has subsequently been proved to he the fact, viz., that gold-bearing rocks would probably he found situated in strata more recent than those of paleozoic age.* Your readers will perhaps be a little indulgent for some prolixity on the suhject, as there evidently exists, as will be seen from a quotation below from a statement made hy Professor Brewer, to ignore my claims to having anticipated such a probability. Under the head of "The Age of Gold-Bearing Rocks," a series of articles was commenced by me in the *Alta California*, on the 18th of August, 1863. The original design of this serics was to have comprehended the entire suhject in all the phases associated with the sciences of chemistry and geology, one small portion of which will form the terminal of this paper. The reasons why this course was not followed, will be found in the articles alluded to in the first foot-note. †Subsequently to the date named, the first announcement which appeared on the same suhject, was in *Silliman's Journal* for September, 1864, in which will he found the following passage: "As far as California is concerned, so far from gold being limited *to Silurian Rocks, this metal occurs in no inconsiderable quantity in metamorphic rocks of as recent age as the Cretaceous.*"

On Octoher 3d, of the same year, Professor Blake read a paper hefore the California Academy of Sciences, relating to certain cretaceous fossils found in the vicinity of the Pine Tree Lead, Mariposa County. Professor B. had had his attention called thereto by Miss Errington, of Bear Valley, and it was not I believe until 1855, that Professor Whitney announced that Mr. Clarence King had discovered fossils of Jurassic age, a fact, however, kept so secret that Professor Brewer has admitted that "the atteution of Mr. Gahh and myself (Professor Brewer) was first directed to those particular species by this announcement"—made as ahove by Professor Blake. Professor Brewer, in criticising some statements made by Professor Blake, relative to any one having previously similarly theorized on this suhject, has observed: "As he does not cite his authorities in the case, I cannot positively deny that such *surmises* may have been printed, but I never saw them until *after* September, 1864; since which date, certaiu writers have recollected that they have arrived at these conclusions, and are now putting forth claims for their discoveries." If Professor Brewer will ohtain access to the *Alta California* of the 10th of Decemher, 1863, he will find an article which was written by me, under the same caption as this paper containing the following passage: "He (the present writer) was at any time prepared to hear and have satisfactory evidence adduced, that auriferous bearing quartz, pyrites, or veins of these minerals, mixed in any or all proportions, had heen found in strata of the latest periods,"—a theory, by the way, which I have held for twenty years.

In the last numher of this journal, Sir R. Murchison is represented to admit that where certain igneous eruptious penetrate secondary deposits, the latter have heen rendered auriferous; hut in conclusion, No. 3, Sir R. very superfluously states "that all secondary and tertiary deposits (except the auriferous detritus in the lattor) not so specially affected, never contain gold." But are not the paleozoic rocks exactly similarly circumstanced, viz., totally devoid of gold where igneous agency has been entirely absent? The fact is, the error committed in connecting the presence of gold as only being associated with paleozoic rocks, has arisen from the circumstance of associating age as an elementary constant, in place of physical influence as a constaut arising from the contiguity of igneous rocks.

The fact may or maynot he true, as stated by Sir R. M., that the veinstones of the lower siluriau rocks contain the greatest quantity of gold. With all due deference, however, to an authority which I so highly respect, I am inclined to think that the veinstones of the secondary formation are the richer of the two. The reasons, however, which I have to assign why this order may in some cases he reversed, I must defer for another week.

* Such readers as may feel disposed to seek fuller information on this subject, are referred to the files of the *Alta California*, from the 18th of August to the 10th of December, 1863, and vols. X and XI of the MINING AND SCIENTIFIC PRESS.

† Mr. D. Forbes had an article in the seventeenth volume of the proceedings of the London Geological Society (about 1862) on a closely allied topic, which possibly may have made a similar allusion; but that paper has never been seen by the present writer. I may also state that within the past eighteen months it has been mentioned to the writer, that a somewhat similar theory appeared about eighteen years ago; but in what publication my informant could not remember.

[Written for the Mining and Scientific Press.]

Metallic Deposits--Gold Nuggets--Theory as to their Formation.

BY DR. LANSZWEERT.

EDITORS PRESS:—In my article on the reduction and concentration of auriferous ores, puhlished iu the MINING AND SCIENTIFIC PRESS, March 30th, 1865, I notice some interesting discoveries, showiug the comparatively modern date of the deposition of gold. In the MINING AND SCIENTIFIC PRESS, April 25th, 1868, appears a paragraph hy Prof. T. Sterry Hunt, as puhlished in 1861: "That the metals of the Quebec group seem to have been originally brought to the surface in watery solutiou, from which we conceive them to have hoen separated by the reducing agency of organic matter in the form of sulphurets, or in the nativo state, and mingled with the contemporaneous sediments, where they occur in seeds, in disseminated grains, forming *fahlbands*, or, as at Acton, Canada, are the cementing material of conglomerates." The above quotations may justify a few words hearing directly upon the subject which heads this article, having a practical as well as a scientific interest to the mining community of California.

Many large masses of gold have been taken from the placers of California, at various times, of which no authentic record or description has heen kept. In 1864 a large mass, one hundred and eighty-seven ounces (fifteen and seven-twelfths pounds) was taken from the Middle Fork of the American River, ahont two miles from Michigan Bluffs, Placer County. The Carson Hill quartz claim, in Calaveras County, is celebrated for the size and weight of the masses of gold taken from it, some of which weighed six or seven pounds.

The origin of nuggets has ever been a posing problem to sciencé. Every one concurs in the belief that all alluvial gold has heen derived, at some time or other, from lodes; but seeing that the largest piece of gold ever fonnd in the matrix is iusignificant, when compared with the nuggets which have sometimes heen found in the alluvial, it has been a difficult matter to reconcile helief with experience. The well-known geologist, Mr. Selwyn, some short time since hroached an ingenious theory, which carried with it something of plausihility, suggesting the probability that gold might exist in solution, in the mineral water permeating the silurian rock, aud in the gold drifts; aud that this water, in its passage through the drifts, became, by some uuknown means, decomposed, influencing the precipitation of the gold, which concreted, (so to speak) around the most congenial nucleus presented to it,—such as the particles or pieces of gold existing in the drifts, or any other metallic suhstances for which it had an affinity. Mr. Charles Wilkinson, in a paper read hefore the Royal Society, relates the following as illustrative of the solution of this very puzzling question.

Mr. Daintree, formerly of the Australian Geological Survey, had on one occasion prepared for photographic uses a solution of chloride of gold, leaving in it a small piece of metallic gold undissolved. Accidentally, some extraneous suhstance, supposed to be a piece of cork, had fallen into the solution, decomposing it, and causing the gold to precipitate and deposit itself in a metallic state, as in the electrotyping process, around the small piece of undissolved gold, increasing it in size to two or three times its original dimensions. Considering this accidental experiment of Mr. Daintree as in some measure hearing out Mr. Selwyn's hypothesis, Mr. Wilkinson was induced to make a few simple experiments, using the most convenient salt of gold—the terchloride—and employing wood as the decomposing ageut, in order to imitate as closely as possible the organic matter supposed to decompose the solution circulating through the gold-hearing drifts. He first immersed a piece of cubic irou pyrites, taken from the coal formation at Cape Osway, far distant from auy gold-hearing rocks, and therefore less likely to contain gold than other pyrites. This specimen was kept in a diluted solution for ahout three weeks, within which time it was completely covered with a bright film of metallic gold. He afterwards filed off the gold from oue side of tho pyrites, and the gold of the surrounding coating was thicker than ordinary note paper. If the condition had coutinued favorable for a very lengthened period, this specimen would doubtless have formed the nucleus of a large nugget. Crystals of gold have been found to contaiu *nuclei* of brown iron ore and undecomposed iron pyrites.

Another specimen of cubic iron pyrites was immersed in a solution of about four grains of the chloride of gold to one ounce of water. Iu a short timo, however, it was found that in such a strong solution the pyrites hegan to he decomposed; but after diluting to ahout two grains to one ounce of water, this decomposition apparently ceased, and metallic gold deposited wherever a particle of the sulphide existed, alike in crevices as on the surface of the quartz; also assuming a remarkable mammillary form. This was kept in the solution for a week. Another piece of iron pyrites, and also one of galena, was kept in a solution of one grain of chloride to one ounce of water, for eight days, when the gold was so deposited on hoth, that a person was unable to distinguish ono sulphide from the other.

A weak solution produces more perfect results than a strong one. With the latter, the sulphides are partly decomposed, and the gold is covered with a dark brown, powdery film. This film does not prevent the growth of the gold in tho solution, as it may be easily rubbed off. Iron, copper, and arsenical pyrites, antimony, galena, molybdenite, zinc-blende and wolfram, were treated in the ahove manner, with similar results. Brown iron ore, and quartz covered with peroxide of iron, were also tried in the same way; but the gold was deposited only as a fine metallic powder. In the above experiments, a small chip of wood was employed as the decomposing agent.

In one instance, a small piece of leather was employed. All through the wood and leather, gold was disseminated in fine particles, and when cut through, the characteristic metallic lustre was brightly reflected. Experiments were made by immersing sulphides in the solution without organic matter; but they remained unaltered. Iron pyrites were tried with metallic copper, zinc and iron as decomposing agents; hut metallic gold was deposited only as a fine powder, which settled at the bottom of the vessel.

From these experiments, it would appear that *organic* matter is the necessary chemical agent to decomposo a solution of the chloride of gold, in order to precipitate the gold as a *coherent* coating around a nucleus presented to it, and that so far as has yet been tried, iron, copper aud arsenical pyrites, galena, antimony, molybdenite, hlend, wolfram and metallic gold, constitute especially favorahle *nuclei* for the demonstration of this chemical reaction. Organic substances, such as fragments of wood, roots of trees, etc., exist abundantly in the gold drifts. It remains, therefore, a point of great importance to decido whether gold is actually in solution in the mineral water circulating through our rocks and drifts. I am not aware that any direct experiments have heen made to solve this question. But that gold has been found throughout iron pyrites, not only in California, hnt also in Australia, by Messrs. Daintree and Newherry, certainly corrohorates this theory. Analogy, however, though a truthful guide, if relied upon too implicitly in outward semhlances, may lead to erroneous conclusions. Nevertheless, striking similarity in the surface of the artificial production to that of the natural gold, is a point worth noticing. For if the form of the latter is the result of ahrasion of its surface hy the material carried along by the streams that once swept down tho course of the old "leads"—then the analogy will not hold good.

The occurrence of larger nuggets of gold in gravel deposits, than have ever been found in quartz ledges, coupled with the fact that alluvial gold is almost universally of a higher standard of fineness than that ohtained from quartz, would of itself seem to imply a different origin for the two. As an evidence of this fact we may refer to the nugget, already referred to (no data of its weight) found at Downievillo, and assayed by the late firm of Wass, Molitor & Co., which was found to be 992-thousandth fine. The experiments already referred to of the decomposition and re-deposition of a very fine quality of gold, under circumstances almost precisely similar to those which exist in all our gravel deposits, wonld also seem to point as to a similar law for the probahle aggregation of nuggets. This same law will moreover account for the presence of auri'e.ous deposits in fossilized wood, imbedded in auiiferous gravel; also for the fact that gold is sometimes found inclosing a nucleus of brown irou ore etc.

That gold may be greatly purified by dissolving and re-precipitating it, is strong evidence in favor of the theory of attrihnting to a similar cause the greater purity, generally, of alluvial than quartz gold.

Mr. William Shiress, of Sandhurst, Australia, remarks that the prevailing alloy of gold, found in the gold fields of Victoria, is silver; and according to his experience, large nuggets are of a lower standard thau smaller particles found in the same gravel, and that the finer the particles are, the higher the quality of gold. In several localities he says the silver fouud, was one-twelfth or more of the weight of the gold. Silver cannot remain in solution in conjunction with the chloride of gold; so that the source from whence alluvial gold containing silver is derived, must be other than a chloride solution,—for two metals, when aggregated together, must be precipitated from a mutual solvent. No such solvent is known to science; or at least no solvent is known to possess such a power, not even in mineral water.

In *Dicker's Record* of July 24, 1866, a statement is made to the effect that all nuggets of any considerable size, which have been found in Victoria, have heen discovered in the immediate neighhorhood of recent volcanic action; and from this fact the theory is proposed by Mr. Selwyn, that such nuggets have been formed hy the melting together of smaller particles. Up to that period the premises from which this deduction was drawn, were correct; hut more recently quite large nuggets have heen found in North Gipps Land and at Wood's Point, localities where there is no evidence of any volcanic action whatever. How far these discoveries may go toward disturbing the volcanic theory, I do not presume to say, and will close this communicatiou by simply stating that my object in the ahove has simply been to further the ends of science, hy stirring to fresh exertion the minds of some of our California iuvestigators.

FEELING SOUND.—Dr. Peet has discovered a very curious fact—that deaf persons can *feel* a drum when beaten. They feel the reverherations as if striking the soles of their feet and passing up to the regions of the heart. He has made a curious application of the discovery, having an alphabet which he beats on the drum, and the mutes, with their backs turned, write the words spelled in that way.

THE AGE AND RETURNS OF THE FREIBERG MINES.—It has heen calculated by Prof. Breithaupt that during the 640 years which they had been worked, dating down to 1825, the mines of Freiberg produced not less than 82,000 cwt. of silver, and that the amount yielded in 1850 alone was not less than 800,000 thalers.

Mechanical.

Melting and Casting Wrought Iron.

An experiment was tried some years ago, at the Mersey Steel Works, in England, of fusing wrought iron, with the view of casting into such shapes as cranks, cross-heads, and other forms difficult to forge, but which were required by engineers. The experiment succeeded admirably, so far as to obtain most excellent castings; but it was found that such deterioration took place in the structure of the iron, when passing from a fluid to a solid state, as to render cast wrought iron but little superior to ordinary cast iron.

These experiments were undertaken while Mr. Bessemer was engaged in *his* early experiments, and it was especially noticed that the fracture of the cast wrought iron presented a very similar appearance to the Bessemer steel ingots when broken. It was found that crystallization took place in the same manner during the cooling of wrought iron, as ordinarily takes place with other substances when passing from a fluid to a solid state. The heat required for melting wrought iron is vastly greater than that required for melting cast iron; and is obtained only with great difficulty, even in the best constructed furnaces. Scrap iron of the best quality was used for these castings.

Although the experiments resulted in an utter failure, so far as the main object of their undertaking was concerned, they nevertheless led to the development of a fact of much importance in connection with heavy forging operations.

The idea was current at this time, that large masses of wrought iron, from long continued heating, have a tendency to crystallize, and lose the fibrous quality peculiar to that kind of iron—an idea under which Mr. Nasmyth's experiments for constructing forged cannon of large size, had just before been abandoned. It was supposed that the *great length of time* employed in heating such large masses, and subsequently in forging and shaping them, gradually produced the change from a fibrous to crystalline texture.

The experience gained in making wrought iron castings, during the experiments at the Mersey Steel Works, developed the true cause of the crystallization of such iron, when brought about by furnace operations; and the subsequent successful production of forged masses, much greater in size than those operated on by Mr. Nasmyth, have practically demonstrated the incorrectness of the former theory. The real cause of the change in the texture of the iron is due to overheating. In heating such large masses, the fires are urged too rapidly, so that the outside first, and subsequently the whole mass of the forging, is reduced to a pasty or semi-fluid condition. When such a degree of heat is attained, the fibrous structure is inevitably destroyed, and, in the process of cooling the mass, crystallization inevitably takes place. The iron, under such circumstances, is sometimes said to be "burned." The degree of heat which will produce this change is much greater than that required for forging.

True, wrought iron, when subjected for a long time to constant alternations of heat and cold, will lose its fibrous structure, much as it does when subjected, for a lengthy period, to constant vibration—for heat is nothing but another mode of setting the particles of iron in motion—but a simple continued condition of heat, however great, short of complete or partial fusion, will never produce any material change in the structure of wrought iron.

Iron for Grinding Purposes.—Grinding with a cast iron wheel at high velocity is a process successfully conducted at many shops, and which has been found to be both economical and efficient.

Tenacity of Metals and Alloys.—The following experiments have been made to test the tenacity of metals and alloys, with the annexed results. The tension was obtained by the use of a winch, and measured by a spring balance. The wires used were double, gauge No. 23:

	Breaking strain for double wires.
Tin	under 7 lbs.
Lead	" 7 lbs.
Gold	" 8.
Copper	" 30 lbs.
Silver	" 50 lbs.
Platinum	" 50 lbs.
Iron	" 90 lbs.
Tin-lead alloy	under 7 lbs.
Tin copper alloy (12 per cent. copper)	about 7 lbs.
Copper-tin alloy (12 per cent tin)	" 90 lbs.
Gold copper alloy	" 75 lbs.
Silver-platinum alloy	" 80 lbs.
Steel	above 200 lbs

Testing Steam Boilers.—Prof. S. W. Robinson, of the University of Michigan, proposes to the engineer who wishes to determine the pressure to which his boiler can be worked with safety, the following very simple process: Let the boiler be filled entirely full of cold water, even to the throttle and safety valves, and all closed tight to prevent any escape. Now, by lighting a fire under the boiler, the water will be gradually expanded, and produce a pressure sufficient even to rupture the iron before the temperature of the water arrives at the boiling point. While the pressure is increasing, let the steam gauge or pressure indicator be watched; and when the test pressure, which may be twice or more times as great as the working pressure, is reached, a portion of the water may be allowed to escape, and the pressure reduced. The pressure results from the fact that water expands more by heat than iron, at a corresponding temperature. The process given above is attended with as much safety as the use of the hydrostatic press, unless the water be heated over 212° Fah., which would not be required unless the boiler leaks. Below this temperature no disastrous consequences would follow, even if the boiler should be torn asunder, inasmuch as explosions result from the sudden expansion of gases or vapors.

The Loss of Power by the Crank.—The crank is simply a mechanical medium of transmitting motion, or rather of transmitting the direction of power. No loss of the power has ever been discovered by the use of this means, and no real advantage gained by the substitution of other means of changing rotary into rectilinear motion, or *vice versa*. Practically, the speculative objections against the crank with the experiments based on them have never produced any device superior. The continued battle carried on against the crank, as a means to the end in view, has always ended in the discomfiture of the aggressor; the best method would seem to be to produce a new device and prove its superiority to the crank. The discovery will be welcomed by every earnest and honest mechanic.

Copper and Iron may be smelted together in almost all proportions, but it appears to be doubtful whether any homogeneous alloys can be produced. A small quantity of iron, added to bronze or brass, causes a considerable increase in tenacity. Malleable iron or steel, containing copper to the extent of 1.45 or 0.5 per cent. shows symptoms of red shortness, which become decided with a larger quantity.

Railway Resistance.—The resistance of a railway truck is about 7 lbs. per ton of gross load on a level; on an incline of 1 in 20 the resistance per ton will be 7 lbs. and one-twentieth of the load; on an incline of 1 in 30 it will be 7 lbs. and one-thirtieth of the load, and so on. At a fair walking pace a horse can maintain a steady pull of 180 lbs. to 200 lbs. on his traces. For a short distance he can pull much more than 200 lbs.

Working Inclined Planes.—Within the last few years rolled hoop iron has been substituted for wire ropes on some of the inclined railroad planes, in the Atlantic States, and have been found to work well. They appear to possess quite as much durability as the ropes, while the first cost is much less.

Sheet Iron Chimneys.—Minneapolis, Minn., has produced a sheet iron chimney which is made of three sheet iron cylinders, the space between the outer and second one being filled with ashes, thus securing safety from fire. It is lighter and safer than brick.

A one-horse power paper steamboat is being built at Ballston, N. Y.

Scientific Miscellany.

Champagne, etc., from Petroleum.—The fact is well known that Berthelot, long since, has succeeded in forming alcohol from the union of olifiant gas with water. Later experiments with the marsh gas series of hydrocarbons have also resulted in the production of an alcoholic beverage. It should be known that all productions of this character, from inorganic substances, although identical in composition with those derived from organisms, nevertheless possess certain properties quite unlike the latter—and properties, too, which totally unfit them for being taken into the stomach. In these days of adulterations, however, it may be useless to warn those who may require alcohol for medicinal purposes against the use of any decoctions containing spirit not made from sugar, grain, or the grape, from the fact that the real safeguard against this class of adulterations lies in the circumstance that no chemist has yet succeeded in producing from hydrocarbons, alcohol at as low cost as it can be made from Indian corn; and further, in the probability that the large area of land now being devoted to vineyards will result in the production of mild wines much cheaper than "doctored" dilutions of corn whisky, constituting the imitation.

Formation of Dendrites.—At a recent meeting of the Royal Geological Society of Ireland, Dr. Emerson Reynolds read a paper "On the Formation of Dendrites," an abstract of which we find published in the London *Chemical News*. He had some years since noticed that when solutions of salts, etc., were placed upon a plate of clean glass, and the glass placed between the poles of a Ruhmkorff's coil, the salts gradually work over the surface of the glass in beautiful moss-like forms, which in many cases were characteristic of the compound contained in solution—the state of dilution at the same time having considerable influence. The author proposed to call them "electric cohesion figures." To produce them we will say that a drop of a solution of cyanide of potassium is put in the center of a plate of glass, which is then placed upon a sheet of tin-foil. One pole of the coil is then brought into contact with the foil (it is immaterial which), and the other pole is placed in the center of the drop, immediately on passing the current the solution begins to creep over the surface of the glass in moss-like convolutions. The dendritic markings on minerals, the author believed, were formed under a similar condition. He exhibited a beautiful manganous dendrite taken out of the museum. It was a slab of concoidal limestone, and in Dr. Reynold's opinion illustrated his electrical explanation conclusively. There was originally a flaw in the limestone which was exactly at right angles with the plane of cleavage. Through these flaws, as was evident by the marks, the manganous solution had percolated, and had perhaps ultimately been the means of making the stone part in two, not, however, in the direction of the flaws, but in the plane of cleavage. The dendrites which were formed upon the surface, in this case were produced from the well known fact, that the two surfaces, at the instant of their separation, are in opposite electrical conditions. This phenomena may be illustrated to a certain extent, by inserting a drop of the fluid into the interstices of a plate of mica, and then, on suddenly parting the plate, the dendritic forms are shown. To fix them, the author dusts some finely dried pigment over the surface of the still moist plate, and then fixes this by some transparent varnish.

The Science of Fruit Syrups.—There is a fact of considerable importance which should be considered by persons engaged in preparing preserves: Cane sugar, by long boiling, is turned into grape sugar, and thus loses one-third of its sweetness. Grape sugar is less soluble than cane sugar, and when fruit juice has been sweetened and boiled for a long time, the grape sugar separates in the form of white crystals, and the juice is found to be deficient in sweetness. to obviate this, let the fruit juice be boiled by itself until brought to the proper consistence, and after it has become lukewarm, add the required quantity of white or loaf sugar. It will dissolve quite readily, and two important objects will be attained: First, a saving of sugar; second, the actual preservation of the fruit free from any of the effects of fermentation.

Color of Sun-Spots.—Before the Manchester Philosophical Society, at a meeting held April 14th, 1868, Mr. S. Broughton said that, on recently observing with high powers a group of fine spots on the sun, one of which was of considerable magnitude, it occurred to him to remove the dark glass, and by keeping the eye much beyond the focus of the heating rays, and at such a distance that the spot almost filled the apparent field of the eye-piece, to see if any phenomena could be observed different from those seen through the dark glass. The spot was at once seen to be of a dark red; but thinking this perhaps might be from the strong contrast of color, he attached a disk of plaster of paris to the telescope, and projected the image of the spot on it. On looking at this with a common pocket magnifier, the image was observed to be a dark blood red, although the observatory was not darkened, and the disk merely shielded from the direct rays by an intervening obaque substance. If these observations are confirmed, it will corroborate the opinion long held that the spots are not black, but appear so by contrast, and, as it would seem, from the intervention of the colored glass.

Size of the Stars.—How large are the stars, and are they alike, or do they differ in size? It used to be conjectured that they are of somewhat similar magnitude, presumably about as great as our sun, and that the differences of apparent size are due to differences of distance; but when astronomers came to discover that some of the smaller stars are nearest to our system, this idea fell to the ground. A German computer has now, however, calculated the actual dimensions of one particular star, and finds that its mass is rather more than three times that of the sun. The star in question is of less than the fourth magnitude—a comparatively small one. What, then, must be the size of those of the Sirius and Aldeharan class? The reason of its selection for this determination was, that it is one of the components of what is called a binary system—two stars revolving about each other, like sun and planet—and the motion of the members of such a system afford data for the computation. The star's distance from us is a million and a quarter times that of the earth from the sun, so that light takes twenty years to travel hither from it.

Action of Water on Lead.—Prof. Bottger, inquiring into the cause of the action of distilled water on lead, has found it to be due to the presence of carbonate of ammonia, and not, as is usually ascribed, to the air dissolved in the water. After having been boiled for a time, distilled water will not attack the lead until after a considerable exposure, when a reabsorption of ammonia and carbonic acid from the air where they are always present, may be supposed to have taken place. Bottger has further found that the alloying of the lead with a small amount of tin protects the former from being acted upon, and this fact suggests the advantage of purposely introducing a little tin into the metal from which lead piping is to be manufactured.

Singular Fact.—The *Engineer* notices a singular fact in relation to the behavior of the steam engine employed to drive one of Mr. Wilde's electro-magnetic engines. It appears that whenever pieces of iron rods or wires are placed in the circuit to be heated, *the engine slackens speed* when the metal begins to redden, the resistance to the action of the engine perceptibly increases in proportion as the heat of the metal increases, and it is only by the constant care of the engineer that a uniform rate of motion can be secured.

The Lava of Vesuvius.—M. Silvestri observed the eruption of Vesuvius in December last at maximum activity, and analyzed many of its volcanic products. The lava is dark gray, and sometimes greenish or reddish on the surface, has a crystalline structure, and exerts an energetic action on the magnetic needle. He classifies the lava in three kinds, varying in density from 2.46 to 2.81. One compact variety contained about two per cent. of water. Three distinct sublimates were found composed mainly of chloride of potassium and sodium and traces of copper. The greenish-brown sublimate contained 9.85 per cent. of copper.

New Chemical Discoveries.—Dr. Hoffmann has announced the discovery of a new acid, which bears the same relation to naphthaline that acetic acid bears to marsh-gas. A short time since the same eminent chemist communicated to the Royal Society the discovery of "the mustard oil of the ethyl series."

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, Aug. 3d, 1868.

President Blake in the Chair.

Messrs. A. L. Nolf, A. Warren and L. L. Treadwell, were balloted for, and declared duly elected.

APPOINTMENT OF AN ASSISTANT.

The President stated that the Council had determined to employ some one to keep the accounts in order, and look after the general business of the Society, which was now much in arrears, as the various Secretaries had no time to attend to it. The assistant would have a commission on his collections, and it was proposed to subscribe among themselves as much as would make the matter worth his while. The Council had already subscribed some twenty-five dollars per month toward this end, and the members would be asked to help.

LECTURE BY DR. GIBBONS.

Dr. Henry Gibbons was called upon by the President to deliver a lecture on Microscopic Parasites. The obscurity which attended these creatures furnished many plausible arguments for the theory of spontaneous generation. It used to be supposed that barnacles were formed from the froth of the sea, and that ducks and geese came from barnacles, by something like a Darwinian theory of selection. He alluded to the well known horse-hair worm, which many supposed to be the result of the vitalization of horse-hairs by placing them in running water. These worms had been found in the bodies of live grasshoppers, who seemed to enjoy life just as well as though they had been free from the parasites. The lecturer spoke of a worm which was even now appearing in the States. This animal pierced the limbs of fruit trees, and then laid its eggs. The limbs afterwards withered and broke off, falling to the ground. These insects appeared only once in 17 years. He remembered them first in 1817, next in 1834, then in 1851, and now again in 1868. He had no doubt of the correctness of this theory, though what became of the insects during the seventeen years he was unable to say. He only adduced this as an instance of the difficulty which naturalists encountered in tracing the origin and the cause of many of these parasites. He then gave an interesting account, illustrated by diagrams, of the growth of the yeast plant, which is produced by the simple multiplication of cells. Other minute plants, such as the *algæ*, or mosses, were propagated by spores, and others again were propagated by a distinct fructification. Animals also had different modes of propagation. One of these he described, as shown in a worm which was horn with certain rings or divisions round it. These rings or divisions gradually deepened, until the animal split into two or three, each of which segments set up a life of its own, and continued to divide and sub-divide until the smallest division, instead of breaking up, extended itself to the length of one inch, and proceeded to generate in the ordinary manner.

The potato disease was propagated by a microscopic plant, the spores of which were so small as to be invisible to the naked eye, and thus it was quite possible that the air might be quite full of them without their being perceptible. Mildew, blight and the smut of wheat arose in the same way, and the dry rot which affected timber was a fungoid growth. The "mother" of vinegar, as it was called, was a similar growth, and he had seen bread, brought over from Germany in emigrant ships, in which a vegetable growth had appeared which resembled a mass of clotted blood, and caused the food to be called "bloody bread." Some of the lower forms of vegetable life were apt to be mistaken for animals. Such were the *cilia*, or resemblance of eyelashes, which filament, appended to cells, at times moved, and gave rise to the idea that it was part of an animal. Such was the *volvox*, which was thought to be an animal because it moved through the water.

Recent microscopical investigations had led to the belief that the *spermatozoa*, until lately supposed to have animal life, were, really, only vegetable, furnished with *cilia*, whose motion led to the mistake. Vegetables were often formed in the intestines of animals, nor was the human animal exempt from these *entozoa*, although he was freer from them in America than in the European countries. *Entozoa* seldom had *entozoa* within them, but they were found to contain vegetable parasites. Thorough cooking killed *entozoa*, but they might survive partial cooking, and breed in the intestines.

The lecturer then proceeded to show by illustrations how insects were afflicted with vegetable parasites. In one instance a small beetle had been found to contain what, enlarged by the microscope, looked like a cactus some twelve feet long, to which a couple of good sized gooseberry bushes were growing. Other animals, eels, etc., carried about with them alternate nuisances, in the shape of vegetable and animal parasites, some of which preferred the interior and others the exterior of the animal, but showing a partiality for the region of the stomach at most times.

The science of microscopic parasites had associated itself latterly with the study of medicine, it having been found that some forty-six varieties of skin diseases were produced by vegetable growths. It had been asserted by Salisbury that intermittent fevers were produced in this way; but the lecturer doubted this. It had been asserted also that malignant cholera was owing to a vegetable growth in the intestines, but it was difficult to tell whether the vegetable growth was a cause or an effect. He believed, however, that, as was generally the case with new discoveries, this was being carried too far, and scientific men would probably eventually settle down far within the mark aimed at by Salisbury. He gave an interesting account of the tape-worm, which was really the development of a worm which could only be developed in the intestinal canals of certain animals. When the germ, which was taken in the food or drink, found its way through the intestinal canal, it frequently caused hydatids, themselves thought at one time to be living animals. When the germ remained in the intestine, however, it developed into the true tape-worm, of which the hydatid was only an undeveloped effect. In some parts of the world tape-worm was very prevalent, and was said to be extremely common in Norway.

Dr. Kellogg observed that the wild rabbit of this country was much affected by hydatids, and that he knew of several cases wherein persons attributed tape-worm to the eating of such food.—*Times.*

LARGE LUMPS OF COAL.—A mass of coal weighing nearly three tons, was recently taken out of an English coal mine, (Wyndam Pit, Agmoro Valley). This lump was taken out for exhibition at the neigbboring Plymouth Fair. This was considered a very large lump of coal, and greatly admired and wondered at.

Large as this lump was, however, an other was soon afterwards raised from the same mine, by the side of which this was but a diminished specimen of a "black diamond." The second lump could not be weighed by any appliance at hand, but was estimated to weigh over *eleven tons*. The labor and cost of getting out this monster block was very great, and was personally supervised by a most experienced staff of mining engineers. After it was loosened from its "bed" it had to be moved about 50 feet to reach the bottom of the pit, up which it was hoisted with the greatest difficulty. The operation of raising, by aid of steam, horse and man power, occupied thirty-five hours of constant labor. The block was carefully protected by clamps, and bound around with heavy iron tackle to prevent its falling into pieces. With all their precaution, however, it was badly cracked, though held from falling apart by its iron bands. This is probably the largest piece of coal ever moved in a single block. It was to be sent to the French Industrial Exhibition at Havre.

THE PETROLEUM YIELD OF THE UNITED STATES, although it has slightly fallen off within the last two years, is by no means materially on the decrease, notwithstanding the dying out of the late petroleum fever. The quantity of refined petroleum exported is also kept up. The export for the three years past has been as follows: In 1865, 755,456 barrels were sent abroad; in 1866, 1,679,400; in 1867, 1,679,112. The production of 1867 was about 4,000,000 barrels; the production for the present year, according to the best authorities, will come fully up to 3,650,000, and may possibly reach the higher figure of 1867.

VISITORS at the Fair will now have an opportunity of getting spectacles of any kind they want and adapted to their eyes, at Muller's Spectacle Emporium, 205 Montgomery street, near Bush. *

California Inventions.

If we were seeking for evidence to prove that any particular class of individuals was really an enlightened and thinking class, we would desire none better than a knowledge of the fact that they were inventors. Inventors are always thinkers. A few, indeed, may accidentally stumble upon some new device, but their inventions are generally of an unimportant character. New discoveries are made daily—some may benefit mankind; others fall to the ground without ever receiving a second notice. Of the latter kind, a great majority are the result of accidents, or are originated in the brain of some person whose sole aim is to raise a stake, by making some one think that he has something valuable, merely because he has a patent. But nothing is more true than the old adage, that "necessity is the mother of invention."

In this State, our strong hold is on mining machinery, devices for separating gold from the rock as it is found in its natural state and saving it; and in this we excel. The cause is necessity. We found here mountains in whose bowels lay millions of dollars, as they were deposited by the mysterious workings of Nature. To extract and save this it was necessary to have the proper machinery and processes for working the ore. Our State, and the Pacific Coast generally, became the home of an intelligent and thinking people, and behold the result—the mountains have been leveled, the gold-bearing rocks have been brought to the surface, crushed, and the gold extracted by means of machinery mostly devised by our own people; and to-day California is credited by miners in all parts of the world, as being the source of our best gold-saving apparatus. Our State is also the home of the originators of several inventions of great value and of different natures. The steam plow and various new anchors of merit, are the result of California genius. All this proves that we are a thinking people, and that we have among us that power which has been the great motor of the American nation—INVENTION.

GOVERNMENT TITLES TO MINES.—It appears from recent intelligence from Washington, that the Commissioner of the General Land Office has just finished and made ready for transmission to this State the first patent issued under the National Mining Act of July 26th, 1866. The patent covers a very valuable quicksilver claim in Monterey County, township No. 18 south, range No. 11, east of Mount Diablo meridian. It appears that applications under this law have not been acted upon as speedily as would be desirable, on account of the novelty involved in the proceedings, and the want of experience in dealing with this class of applications.

The Clear Creek claim was returned to California for correction. On the 11th of June last the papers complete were forwarded, and have reached the General Land Office, meeting all the requirements of the law. The patent just prepared grants 6,000 feet to the Clear Creek lode, with sufficient surface ground for the convenient working of the same; and in point of mechanical execution, it is one of the most beautifully finished documents ever issued from the Department. All other claims under the act will be patented as promptly as the applicants bring themselves within the requirements of the statute, a matter that will be attended with less perplexity in the future than heretofore, on account of the experience that has been acquired by the various officers whose action is needed in the preliminary stages of the proceedings. This branch of the land service is one of the greatest importance, extending its operations over the surface of more than one thousand mineral localities.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

ZECH PIANOFORTE CO.—Aug. 4th. Capital stock, $150,000; 1,500 shares, $100 each. Trustees: Jacob Zech, Chas. Kohler and Edward F. Ohm.

Hall's Patent Knife.

The accompanying cut represents Hall's Patent Jacket Knife and Door Button. The dotted line shows the manner in which the tapering screw is fastened on the back of the knife-handle, so as to permit of its opening and closing. When the screw is at right angles with the handle, the instrument may be used as a button for fastening

a door against burglars; for a cork screw; for making holes for starting screws; for forming a temporary hook for hitching horses, and various other purposes. It adds but little to the weight and expense of an ordinary knife, while it enhances its usefulness. Patented July 23d, 1867. Dr. A. W. Hall, the inventor, No. 208 Broadway, N. Y., is manufacturing the knife in this country, and we wish him success in patronizing American artisans.

DIAMOND MAKING.—Efforts to obtain artificial diamonds will probably never cease until that much-prized jewel is as cheap as the most ordinary variety of precious stones. The latest effort which we have heard of in that direction, is that of a party who directs a stream of chlorine gas upon cast iron kept in a state of fusion. The iron is sublimed in the form of perchloride, and the carbon is left behind, but not, we suspect, in the shape of a diamond. Carbon is always present in cast iron, but no donht uniformly in the graphitoidal form, and all the above experimenter can get for his trouble, will be a little black-lead. The nearest thing to an artificial diamond yet obtained, is in the form of crystallized carbon carried over by a current of electricity from a positive to a negative pole in the production of the electric light by the use of charcoal points.

A LIVE PAPER.—The Reese River *Reveille* is one of our most welcome visitors. We never pick it up, but what we feel that we will be repaid for our trouble before we lay it down, and we are seldom disappointed. Published as it is, in the heart of one of the finest mining regions in the country, it devotes the most of its energies to giving its readers information concerning them, which will surely benefit the Reese River and surrounding country. Every person interested in the development of that portion of Nevada should take it. We value, and would not wish to be without it.

THE NEW YORK POST OFFICE.—The gross amount of mail matter handled in the New York post-office in 1864, was about forty-one tons daily; in 1867 it was ninety-five tons—an increase of 130 per cent. in three years! It now averages, in bulk, 200 wagon loads every day. The number of letters dispatched is about 250,000 per day—an increase of about 400 per cent. in ten years.

WE notice that a job-printing office has been opened here by the ladies' on the co-operative plan, but the most popular and best patronized is the Woman's Cooperative Union, No. 39 Second street, for making and mending shirts and other useful articles. *

THE Mechanics' Fair is thrown open today. A large number will be here from the country. We hope that no one will leave the city without a visit to Woodward's Gardens. More can be seen there for twenty-five cents than anywhere on this continent.

S. T.—1860—X.—The unprecedented and extraordinary demand for Plantation Bitters is evidently owing to their being prepared with pure St. Croix Rum, Calisaya Bark, etc. Our druggists all complain that it is almost impossible to keep a supply, and that their orders, owing to the great demand and limited supply, are but tardily executed. Be sure and get the genuine. *

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

Issued for the Week ending July 21, 1868.

80,063.—Improvement in the Manufacture of Ice.—Robert S. Eghort, Colfax, Cal.:

I claim forming artificial ico in houses or receptacles by spray, sprinkling or dropping water through a pipe or pipes C, or vessels, pierced with holes a, a, a, or their equivalents, substantially as described.

In summer time when the thermometer stands up in the hundreds, ice is one of the appreciable luxuries of life, and in some climates where the cold is not intense enough to freeze ice readily, and where the cold snaps are of short duration, it is difficult to obtain. This invention is intended to overcome those difficulties, and consists of a house or number of houses, arranged with numerous doors, which may be thrown open at night to lower the temperature of the room. A pipe or pipes which are perforated pass through the room, and water is admitted into them from a tank, or otherwise. The water drips through the holes in the pipes, and falling, congeals and forms ice. Branches of trees may be placed beneath the pipe, in order to more thoroughly divide the water, by its falling upon them, causing it to freeze almost instantly. By this means ice can be formed in climates where the outside atmosphere does not affect solid bodies of water, forming in a solid mass of ice.

80,124.—Improvement in Harvester.—Olpha Bonuey, Jr., of San Francisco, Cal.:

1. I claim a helper, of substantially a triangular form, having the upper inclined edge c, and ribs d, for elevating the grain or stalks, as herein recited.

2. The wheel j, adjustable bark, and box l, for the purpose set forth.

80,176.—Improved Bed Bottom.—Philip Hinklo, San Francisco, Cal.:

I claim the combination of the rod *m* in the recess, hands l and k, suspender j, bridge f, wires h, and slats c, as herein set forth.

80,228.—Improvement in Horse Powers.—Andrew Smith, Dayton, Oregon:

I claim the shaft d, in the frame E, arranged so as to be capable of being adjusted in two different directions by means of the screws J, G, connected respectively with the slides H, and bearings E, as indicated by the arrows 1, 2, in combination with the frame A, containing the driving belt D, and rollers c, c, and the belt N, with the shaft K, in frame E, all arranged for joint operation, substantially in the manner as and for the purpose set forth.

REISSUES.

3,443.—Improved Machine for Collecting and Condensing Metallic Vapors.—Ferdinand Formhals, San Francisco, Cal.:

1. I claim in combination with the furnaces A, the screw or submerger F, formed by a covered spiral flange or blade H, H, around a central shaft or axis, substantially as and for the purpose described.

2. Driving the volatile substances from the furnace into the submerging tank E, by the screw F, from thence along the spiral opening to the chamber I, and out through the pipe J, to the condensing tank or tanks, substantially as described.

3,445.—Improvement in Fermenting and Oxidizing Mash, Malt, etc.—R. d'Heureuse, San Francisco, Cal.:

I claim the improved mode of facilitating fermentation or germination by the introduction of air or other gaseous substance of proper temperature and moisture, with mash for distilling vinous or other substances subject to fermentation or germination at or near the bottom of the same, substantially as and for the purpose described.

RECENT INVENTIONS.

New System of Propulsion.—A gentleman of Detroit, Mich., has invented a new system of propulsion, which he claims will revolutionize the present steam method. His plan consists of four iron air-tight cylinders, cone-shaped at the ends, which run the entire length of the boat. In these cylinders are shafts, on which are adjusted continuous screw threads answering for buckets. With these he expects to be able to propel a boat at the rate of thirty-five miles an hour.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

San Francisco, Aug. 7, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.		Per ton.
12 per cent. ore	$16 00	22 per cent. ore	$43 56
13 " "	18 62	23 " "	46 45
14 " "	23 20	24 " "	49 33
15 " "	23 35	25 " "	52 22
16 " "	26 22	26 " "	55 11
17 " "	29 12	27 " "	58 00
18 " "	29 91	28 " "	60 80
19 " "	34 90	29 " "	63 77
20 " "	37 78	30 " "	66 66
21 " "	40 67	31 " "	69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, **505 Clay Street**, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, miner, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS,

All progressive information, in fact, transpiring with the TIMES—which cannot be obtained from books.

The Mining and Scientific Press is now in its Sixteenth Volume, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

Resolved, *That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the* Mining and Scientific Press, *of San Francisco, to the consideration and support of the miners of the Pacific coast.*

Terms of Subscription.—One year, $5; six months, $3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

As an advertising medium throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

Specimen numbers of the Press and Patent Circulars sent free.

DEWEY & CO.,

Jan. 1st, 1868. San Francisco.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, - - - - $1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. Layres (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the *theory*, the letter the *practice* of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools.

To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Swett.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Pelton.*

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable—possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Denman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Hermon Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*I. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * Exactly calculated to interest. * * It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Bowie.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literature, taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times*

Prof. Layres plunges at once "*in medias res.*" He seizes a sentence (which is the unit in composition, whether written or spoken,) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Marysville Appeal.*

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 156 pages.—*Virginia Enterprise.*

Price, $1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, July 25th: The Mountain tunnel has experienced a change; the rock which has been for a long time firm, tenacious granite, is now of a mixed character consisting of quartz and a kind of substance which so far defies classification by the experts here. Much better headway can now be made.

Mr. Thompson of the Pittsburg Co., has a proposition before the Trustees of the IXL Co. to enter their tunnel and drift on the lode, giving them the ore taken out, to the north extension belonging to said Pittsburg Co. Should the terms he accepted, and the two Trustees just here are in favor of it, five men will he put on immediately, and the continuity of the vein he proved.

The Rippon tunnel is now in a broken quartz mass, and shows much ore of low grade. The quartz is getting better as the body is penetrated.

Chronicle, July 25th: The Illinois California have at last got through the hard granite, and are in very easy-going rock, in which no blasting is required, and it is supposed the Sacramento ledge is close at hand.

Last Saturday we were shown a beautiful specimen of crystalline quartz, one of the greatest curiosities ever seen. It was taken out of the Mountain tunnel, near this town, by Supt. McCuen. This specimen is about the size of a man's fist; many of the crystals being over an inch in length and well proportioned. In the center of the specimen, the crystals have formed a small cavity in which there is a small block of quartz, perfectly white and highly polished, resembling a massive block of marble in miniature. The block is about an eigbth of an inch in thickness and about an inch wide and long, and stands upright, the bottom and rear being imbedded in the crystals. It has been sent to San Francisco for exhibition at the Mechanics' Institute Fair, after which it will be exhibited at the State Fair.

Amador County.

Jackson *Ledger*, Aug. 1st: We understand that some very rich rock has recently been taken out of Old Bob's claim about a half mile from town, and that it is getting richer as they sink down.

Another rich vein of rock has been struck in the Coney & Bigelow mine.

Calaveras County.

Chronicle, Aug. 1st: On Thursday last quite a large party assembled at Messrs. Hill & Homer's new quartz mill, to witness the first start. At about 2½ o'clock sufficient steam had been generated and the engine was started. Everything worked smoothly—no jar of the building or creaking of the machinery being felt. The mill and engine, with the exception of the battery, was the Mina Rica, of West Point, and was constructed by Milo J. Ayer, of San Francisco, and is a model of neatness, economy and durability. The battery is one of Mr. Ayer's patent, and is said to be equal to any in use. The engine was set up under the superintendence of Mr. W. E. Glasby. After running about half an hour the engine was stopped. The mill and mine were then formerly christened by Mr. Homer, the Quaker City.

A gentleman from Railroad Flat exhibited to us, one day this week, some very rich specimens of gold-bearing quartz taken from a lead discovered by himself and partner, recently, on the South Fork of the Mokelumne river, in Railroad Flat district. He represents the lead as three feet wide and shewing gold the entire width. The owners think it the same vein on which is located the famous Petticoat claim.

As work on the Petticoat lead progresses, its prospects become more flattering. Mr. Said started the mill the first of this week, after having thoroughly overhauled and repaired it, and is engaged crushing as good rock as ever came from the claim. He expects to be able to take out rock in quantities sufficient to keep the mill constantly employed.

Nevada County.

Transcript, July 31st: We learn that all who are working the bed of Deer Creek are doing well. One company is reported as making $25 per day to the man. Last fall a gentleman sold out a claim on the creek, a short distance below town, for a nominal sum. The buyers have this season been taking out as high as an ounce per day to the man.

At this time in the old and well worked districts new developments are being made. Bedrock tunnels are being run for the purpose of opening basins and channels at greater depth, and new projects are being inaugurated for the same purpose. At Columbia Hill the miners have never been able to work off the rich deposit of gravel half way to the bedrock, and they have been for a year or two endeavoring to make some arrangement by which a bedrock tunnel can be opened from the Yuba, giving the sufficient fall to work out the entire deposit. Near Moore's Flat, the Kentucky Blue Gravel Co. are prospecting for a gravel deposit with an excellent show of success. Several other companies are organized for the same purpose. This channel is out of the district now worked at excellent profit. The range of gravel extending from Quaker Hill to the Cascades on Deer Creek and across the stream, has been comparatively unprospected above Quaker Hill, where mines of great richness have been worked. At the Cascades some five or six prospect tunnels are now being run and excellent prospects have been found, Ragan & Co. taking out as high as $34 to the pan. At Chalk Bluff, Dr. Farnham, and the company of which Mr. Stranahan is superintendent, are engaged in extensive prospecting, and they have succeeded in finding rich gravel. On the Little York ridge, the old Gardiner claims, recently purchased by Squires, Cozzens and Atkins, are being worked at different parts of the county, which are sure to add considerably to the area of ground worked. We have only instanced a few of the operations which have been started for the purpose of developing new mines or working older ones to better advantage. There is still a large district of country in this county entirely unprospected which will in time be opened. The older mines were never yielding better than at the present time, and there is every indication that the yield will not be diminished, at least during the present generation.

Gazette, Aug. 3d: Mr. Perkins, of San Francisco, has discovered an auriferous deposit near Omega, which is supposed to be very rich. The claim was located for a San Francisco company, and Mr. Prescott has been appointed to superintend the opening of the deposit. He has made arrangements to have 20 tons of the rock crushed in the Oriental mill at Nevada. The rock, in quantities almost inexhaustible, can be excavated with the greatest ease, and the crushing can be done very cheap.

Aug. 4th: The necessary repairs on the flume of the South Yuba Co., at Steep Hollow, were completed on Saturday last, and a full head of water for the Snow Mountain ditch again turned on.

EXCELSIOR.—*Transcript*, July 31st: J. Figuiere & Co. have located 1,800 ft. on the Pacific ledge, Meadow Lake district, adjoining the Pacific Co's ground on the north.

Gold Hill *News*, Aug. 3d: The Lake Co. at Meadow Lake, will commence work again soon. There are 700 ft. in the claim, and the ore is rich in free gold, with but very little silver. It assays as high as $175 per ton, and some of it worked in an arastra yielded an average of over $30 per ton.

The Pacific ledge has a shaft 75 feet deep. The ledge is about six ft. wide, and the ore rich in free gold; some of it, worked at Grass Valley, yielded as high as $72 per ton. The company are about having a run of the ore made at the Winton mill, owned by Treadwell, of San Francisco. The Silver Prize is a very excellent location. The Grant and Kentucky Cos. have each struck some very good ore within the past week, and their prospects never looked better.

The famous Mohawk and Montreal mine, at Old Man Mountain, shows an immense amount of work done; more than any other in the district. Plenty of ore averaging $30 per ton is developed, and the new 10-stamp mill of the company is about starting into operation.

Placer County.

Dutch Flat *Enquirer*, Aug. 1st: James Rich and his partners have discovered a ledge of decomposed quartz, near the old Texas diggings, which prospects very rich in gold. A short time since they rigged up a hydraulic and washed out some of the decomposed rock, and after the water was turned off they picked up some $13 or $14 in specimens. They had about 25 ft. pressure, and the rock was so soft as to wash out quite readily. They intend sinking on the ledge, and think the prospects exceedingly flattering.

The Gold Run correspondent writes: Mining is prosecuted here with much vigor, and from all appearances, with success. All the claims that have been working since early winter are still piping away lively, and among those that have but recently commenced, Judd, Huyck and Brogan are now "running the cobble lively," and from all indications will make a long season of it yet. The Home Ticket Co. have suspended operations for this season.

Sierra County.

Downieville *Messenger*, Aug. 1st: The Johnson quartz ledge, near the Docile, is proving richer than the most sanguine anticipated. Last week a body of excellent ore was struck, some of the specimens taken out containing as much as six ozs. gold.

The Gold Lake correspondent writes: At the Illinois claims Messrs. Watson & Co. are taking out a good quality of pay dirt. They get some excellent looking dust, good sized pieces. They are running two shifts of hands, and work both day and night. Further west and on the same range there are several parties engaged in placer mining. The upper claims in the Woodchuck Ravine, are paying well, and will as long as water lasts. The owners of the ground below these, however, have so far failed in finding the channel which the boys above are working on, and have suspended operations. This ravine is supposed to be an outlet of a large main channel which runs through the hill at some point above.

Siskiyou County.

Yreka *Union*, Aug. 1st: On Tuesday last, during the thunder shower, the water in the Big Ditch again burst its boundaries. The break occurred in Scar Face Gulch, in Shasta Valley.

A joint stock company has been formed for the purpose of bringing, by means of a ditch, a more ample supply of water to the rich placers in the vicinity of Muggінsville and Oro Fino.

A rich quartz ledge has been discovered in the Penning claim near Muggінsville. Where it cropped out on the surface the ledge was but a few inches thick, but it widens out as it goes down, and at a depth of eight ft.—as far as has been sunk on it yet—it is 16 in. thick. Mr. Luttrell says it fairly sparkles and glistens with gold. The quartz is soft and easily pulverized, but is incased in very hard rock. The parties who discovered it have taken from it over $100 by means of a small hand mortar and pestle.

Hon. J. K. Luttrell showed us yesterday several slugs taken from the claim of Mooers & Grooms, a short distance north from Muggінsville. These slugs range in weight from $1.75 up to $36.50, and are very handsome specimens. This is one of the best claims now in the county. They washed up over 40 ounces one day this week.

Tuolumne County.

Sonora *Democrat*, Aug 1st: The last crushing of 12 tons of ore from the Green claim, below Uniontown, paid $500.

The iron for the pipe to convey water to Chinese Camp, has arrived at that place.

James Arthur and two other men, have struck a rich quartz claim on Graveyard Hill, west of Jamestown. We saw some fine specimens of pure gold from it a few days ago.

COLORADO.

Georgetown *Miner*, July 16th: Work on the Baker Co's smelting furnace is progressing favorably....J. W. McFarlaud has recently discovered a very fine sulphuret lode on Democrat Mountain....The erection of the Brown Co's mill building was commenced last week, at Brownville, and will be pushed to an early completion....Messrs. Rigsby and Huddleston are raising some very fine ore from the Wm. Penn lode, on Democrat Mountain....Thomas Munsell, has recently discovered a very fine fissure vein on Alpine Mountain, which he proposes to develop thoroughly....A large number of new discoveries have been made the present season on Sherman and Brown mountains, and prospecting is still prosecuted with vigor....A Mr. Knowles, of Chicago, is experimenting with a new smelting furnace at the old Lyon works, below Black Hawk....Packard, Moor & Scott have discovered a very large fissure vein, about half a mile south of the Astor, having the same general characteristics as the latter....From the 21st day of May to the 8th day of July, 1868, inclusive, the German Reduction Works of Huependen have shipped 7,844.97 ozs. of silver bullion, coin value $7,448.62. On the 6th and 8th of July, they shipped 1,859.01 ozs., coin value $1,803.43.....We have valuable deposits of fire clay in this immediate vicinity. John Cree has a vein on Republican Mountain full seven feet wide, and Charles Wentworth has a fine vein on Columbia Mountain. The latter has been and is now being used by Prof. Yonley, for muffles and scorifying dishes, and he pronounces it fully equal to that from Golden City.

A pocket of very rich sulphurets and glance was struck in the Astor lode on Saturday last, by Messrs. Cooper, Fisher & Adams. They raised a half a ton on that day that is estimated to yield about $7,000. Snyder & Peters have a quantity of ore raised from the Snow-drift lode, on Sherman Mountain....John T. Herrick, of the smelting works, shipped on Friday last 222 pounds troy of silver bullion, coin value, $3,596.40. The works are running steadily and with good results....The shaft on the Ashley Franklin lode reached a depth of 60 feet on Saturday last, developing a large vein of fine grained galena, having the appearance of being very rich.

Central City *Register*, July 16th: Intelligence from all quarters of the mining country is of the most encouraging character. Several new and promising silver lodes have recently been discovered on Left Hand Creek, near Gold Hill. Gillespie & Stewart showed us some fine looking surface ore from the Gray Eagle lode, which they recently discovered there....The gold shipments this week will be larger than any previous one....A new discovery on Bobtail Hill is attracting a good deal of attention just now....Ira Austin is sluicing in Gold Dirt Gulch with very fair success....Cushman & Walcott have rented the Lexington mill, and have commenced running it.

From Ward district we learn that the Ni Wot mill continues to crush second quality ore, and pays the expenses of the company while sinking through the cap in their mine. The Edge Hill Co. is running on surface ore from various lodes, and is yielding a good profit. The ore run has averaged over $100 per cord. The Cushman mill is also running with like good results.

DACOTAH.

Sweetwater *Mines*, July 18th: Zabriskie & Co. commence crushing ore in their new arastra in Hermit Gulch, to-day.

Fairfield, Marshall & Co., after crushing six tons of ore from the Gladiator, made a clean up the other day, and got an average of $38.50 per ton. The rock was not closely selected, but if it had been, the yield would have been much greater.

Fish & Co. are down with a shaft eight feet by six, and 28 feet deep, and pushing the shaft to the water, the ore improving every foot as they go down. The vein is five feet wide at the bottom of the shaft, and they have about 25 tons of excellent ore out, without having to put in a single blast as yet. They have found the vein on Churchman & Co's ground, 350 feet south of discovery, and have commenced sinking on as rich ore as Fish & Co. The vein is named the Mastodon, and Churchman & Co. named their location on it Mastodon No. 2. The ledge was not found in any organized mining district, therefore they have formed a new one, making this vein the center, and named it the Oregon Mining district, and bounded it on the north by Pacific district. The vein lies about six miles from Oregon Springs. The ore is chloride and black sulphuret, and is located for seven miles northward, and a mile or a mile and a half southward, and runs in very nearly a straight line. Next north of Fish & Co., Geo. W. B. Dixon, J. P. Thiriott, and L. P. Crandall have located 600 feet by name of the St. Lawrence Co., calling their location Mastodon No. 3, and have commenced sinking upon it. A scientific gentleman, educated in mining at Freiburg, pronounces the ore equal in richness to any he has ever seen.

Messrs. Harrison & Co. have struck another very promising vein about ¼ mile eastward from the Mastodon, and are sinking upon it. These veins lie in the primary granite, which never pinch out nor cap over, and run on the course of all true fissure veins, varying a few degrees from north and south.

The editor gives the following account of a visit to Hamilton City, California district: We found men at work upon Gallagher & Co's claim, and after securing some fine specimens, and witnessing a clean-up of the upper placer claims in the gulch, seeing about 2½ ounces taken out of Holbrook & Co's claim, and about two ounces taken from Comstock & Co's, we started back.

The Helena *Post* of July 11th, says that an old German Gulch miner, who has just returned from a trip to the Sweetwater mines, reports that after prospecting for placer mines during a period of ten months on the tributaries of the Sweetwater, he could not find any ground which yielded more than a color to the pan. He went to the new diggings last fall, by way of Bridger, and found about 100 men scattered through the country. A few good quartz ledges constituted the only gold mines of any consequence in the region he visited, and he affirms that German Gulch alone is more valuable than the whole of the Sweetwater country.

Denver *News*, July 22d: The Sweetwater mines shipped $20,000 gold dust, in one week, recently.

[There must be a mistake somewhere, as

it would seem impossible for such a barren country as the *Post* describes, to ship $20,000 in one week.—Eds. Press.]

MONTANA.

Helena *Post*, July 24th: Claim No. 23, above discovery, at Wilson's Gulch, is paying on an average $30 per day to the hand, and the prospects in neighboring claims indicate ground that is equally rich. The pay gravel is very wide and deep.

The Poor Man's lode, in the Flint Creek country, is proving full as rich as the most sanguine could expect. Some selected ore from this lead was yesterday manipulated by Molitor Bros., and an elegant button of silver extracted from it, showing that ore of that description contained 5,007 ozs. or $6,509.10 to the ton. Two pounds of rock were pulverized, but only one half of the powder was worked, the other half being destined for New York, to be tested there. Fifteen tons of similar selected ore are now on their way here from Flint Creek, ten tons of which will be sent to New York and the other five tons to Berlin, for the purpose of being worked. This ore is taken from a depth of about 20 feet on the lead referred to, and is among the richest ever seen in the Territory.

A short time since one of the richest quartz leads ever found in Montana, was discovered by Wesley Jones & Co., at the head of deep Gulch, near Beartown. This ledge is between two and three feet in width, and the quartz, which is a deep yellow color, shows an abundance of free gold. From one pound of rock recently crushed, $4.00 was obtained, and several other large prospects have been procured. It is well known that Deep Gulch is one of the richest regions in Montana, and it is believed that the ledge just discovered, is the one from which the celebrated mines referred to derived their supply of gold. The mine has been christened the "Radical," and it is proposed to put up an arastra or small mill upon it.

Basin Gulch, near the head of the Boulder, has created considerable excitement recently, a stampede to it having been in operation during the whole of last week. Its distance from here is 30 miles. Claims have been staked for a distance of seven miles, and between 50 or 60 men are now at work opening their ground, and obtain prospects of from three to ten cents to the pan. It is from four to nine feet to bedrock, with from two to four feet stripping. The pay streak, wherever its width has been tested, is from 30 to 100 feet wide. Williams & Co., on last Wednesday, cleaned up $188, the result of a three days' run with six men working. The next claim below them is paying still better. The gold is of a coarse nature. Galena Gulch, between Big and Little Boulder, is now occupied by about 300 men, and is proving good. Two men recently cleaned up $82 for a three days' run. Prospects of from ten to twenty cents to the pan are being obtained.

Letters from Cable state that a rich strike had been made on the Cable lead. The top rock, upon which work was first commenced, had to a certain extent failed, and a new shaft has recently been sunk to a depth of over 100 feet. In this new shaft the ledge has now been struck. It is 30 feet in width, and has an abundance of free gold....The William Nowlan mill was to start yesterday on Cable rock. General Ewing's mill arrived at Cable on Saturday last, and will be erected on the Georgetown side of the Cable Mountain. This mill will be in operation in two months and will work ore from the Keystone lode.

Turnley's mill will soon start up on quartz from the Parke lode, and Ricker's mill will start on Monday....New diggings have been struck near Beartown, on tributaries of Modesty, Prairie and Richardson gulches....El Dorado Bar is dull. Ben. Toole's claim is cleaning up $200 per day with three hands working during the entire 24 hours. His clear profit is $180 per day....Professor Swallow has exchanged the ground formerly owned by the company he represents, on the Ballarat lode at Highland, for other ground on the same lode, on which a tunnel is being run, paying $15,000 "hoot." The Professor keeps between 30 and 40 men constantly at work preparing for his mill.

NEVADA.

Humboldt.

Winnemucca *Argent*, Aug. 1st: From the Golconda mine they shipped this week 389 pounds of bullion. Value, $4,688.

Fall & Co. shipped this week, per Wells, Fargo & Co.'s Express, 2,800 ounces of fine bullion.

The Montezuma Co. shipped this week bullion to the amount of $30,000.

Holt's mill is employed in making experiments on ore from the "Pride of the Mountain"—a ledge in Winnemucca Mountain. He finds the ore rich enough to pay well, and gets satisfactory results in a small prospecting pan, and is trying to apply the same process in the large pans.

J. M. White has brought down another batch of 134 pounds of bullion taken from Golconda mine. It looks beautiful and is worth $1 per ounce. The mine at no time has looked so well. A richer grade of ore has been struck this week, and has every miners' sign of permanency.

Seven hundred feet of the Little Giant ledge at Battle Mountain has been sold to J. H. Atchison, for $$12,500, with the understanding that he is to erect a quartz mill upon it as soon as possible. The greater part of the mill passed here on the 20th inst., and will be at work inside of 60 days. Other parties are at work in the district on ledges of equally promising appearance.

Unionville *Register*, July 25th: The prospects of the Arizona Consolidated S. M. Co. are flattering.

The working of 22 tons of ore, at Golconda mill, Fairview, from the Little Giant mine, yielded 400 pounds of crude bullion, amounting to $5,900.

The Golconda mine is now surpassing itself. The vein is still increasing in size and richness. The mill is shipping several hundred pounds of bullion weekly.

Kyle & Co. are now delivering twelve tuns of ore daily to the mills in town from the Arizona mine, for Fall and Temple.

General McCullock has resumed work on the North Sheba. This mine is looking well.

Bonnifield and Perkins are making negotiations with heavy capitalists for money to carry on the Sheba mine.

Reese River.

Austin *Reveille*, July 24th: A fine vein of ore has been struck in the incline of the Metacom mine.

July 25th: The Manhattan mill was closed yesterday, cause, unknown. The quality of the ore which is produced in the district of White Pine, as well as the condition under which it occurs, are causes of wonder even to the experienced. Thus far several of the claims have been as productive as rich gold placers. We were furnished with data by Mr. J. D. Emersley, who arrived in this city from the district yesterday, which are well calculated to excite wonder. The owners of the Eberhardt South broke ground in their claim just 60 days ago, and the estimated value of the ore extracted during that period is about $150,000. Mr. Emersley examined their various lots of ore, and learned their value as ascertained by assays of the pulp at the Centenary mill, in the Newark district, where transported for reduction. His examination resulted in the following estimates: five tons of the choicest specimens of horn silver, which were carefully selected from the whole mass, will yield at the rate of $5,000 per ton; 110 tons of what is termed first class, a number of tons of which have been worked at the mill, yield pulp assays ranging from $1,000 to $1,400 per ton; 60 tons of second class, lots of which yielded in the mill at the rate of $300 per ton; and 80 tons of third class, the pulp assays of which range from $80 to $100 per ton. The entire expense of taking out the above lots of ore is $1,800. The claim is opened to the depth of 16 feet, and at the bottom the ore appears to be of as good a quality as that found above. The Keystone is a parallel claim, and has already produced ore enough to give each of the owners from $20,000 to $25,000. Several other claims produce good ore, but of a quality greatly inferior to that taken from the two specified.

July 28th: Mr. J. D. Emersley, a resident of White Pine, writes from those mines as follows: The Keystone is now yielding a better quality of ore than the Eberhardt, and bids fair to give an equally liberal return to the parties to whom it belongs as the other has done. No other deposit of equal value to these two has been discovered in the district, though valuable mines are being located almost daily. On the southeastern face of Treasure Hill, about a mile from its summit, a very promising ledge, known as the Best Chance, was located a few weeks ago by the Lake Bros. Another named the Metropolitan was found recently about half a mile below Sherman's new town site. On Treasure Hill there are scores of holes being dug; ore is found almost anywhere that an opening of a few ft. deep is made. Still all of those will not prove mines; hundreds of locations are being made which will never become of any permanent value. Like most new districts, White Pine is being overdone in everything.

July 30th: The El Dorado South, at Silver Bend, is developing wonderful deposits of rich chloride ore along the entire line of the claim. At a point recently uncovered near the southern boundary, the deposit is apparently very extensive, and the ore of a higher grade even than that discovered to the north.

The work on the shaft of the Plymouth Co., which was temporarily stopped, is to be resumed immediately.

Yesterday, 12 bars of bullion, varying from .863 to .993 fine, and valued at $16,216.66, were brought into this city consigned to W. S. Gage & Co. The handsome bars were produced at the mill of the Centenary Co., in the district of Newark, from ore obtained from the Eberhardt South in White Pine district. The lot was shipped yesterday by John A. Paxton & Co.

July 31st: John A. Paxton & Co. received yesterday two bars of bullion from the Knickerbocker mill, near Ione; three bars from the Combination Co. at Silver Bend; and two bars from the Twin River Co. at Ophir Cañon.

Silver Bend *Reporter*, July 29th: Mr. Beaumont, lately from Palmetto district, recently showed us some very fine specimens of ore from two of the most prominent ledges of the district—the Silver Champion and the Kentucky. There are some 2,000 tons of first and second class ore now on the dumps of the Champion mine, carefully selected, and about equal parts of each. They have reached a depth on the Kentucky ledge of 40 feet. They have upon the dumps of this mine about 300 tons of very rich ore. The company is progressing finely with its mill building.

Virginia *Enterprise*, July 29th:—As yet neither the Empire nor Imperial Co. have found milling ore in their respective drifts from 900-foot level of the Imperial-Empire shaft. The two main drifts are progressing slowly in hard, barren, white quartz, and the air is more close, hot and stifling than ever, so much so as to be suffocating and almost unendurable.

The big flume at Gold Hill, which carries the water of Crown Point Ravine through the town, is to be extended a further distance of some 400 feet.

July 31st:—On Saturday last the Imperial mine dispatched to San Francisco $10,000 in bullion. The bullion receipts of the Savage Co., on July account, up to the 27th, aggregate $168,000; and of the Crown Point Co., $57,000.

The new reel-clutch of the Imperial-Empire works has been put in place and the works started up again at 5 o'clock evening before last.

The yield of the Gould & Curry, Savage and Hale & Norcross, from the time of their being opened to April 1, 1868, was a little over $17,000,000. Besides this we may say that the Ophir, Mexican and Central in the same time yielded $8,000,000; the California $400,000, and the Chollar-Potosi $5,000,000, and we have over $40,000,000—saying nothing about the mines of Gold Hill and other mines on the Comstock range.

Aug. 1st: Wells, Fargo & Co. shipped from their offices in this city and Gold Hill, during the past week, 9,469 pounds of assayed bullion, valued at $257,009.35.

A new body of ore was struck yesterday in the lower level of the Hale & Norcross mine. The ore is of a very fine quality, though so hard that it is necessary to blast it out, and occurs at the lowest point in the mine, and some 25 feet lower than the lowest workings in the Savage. The extent of the deposit has not yet been ascertained, though a drift has been cut into it a distance of over three feet. The ore appears to be a new body that comes in from the east, lapping upon the lead from that side.

The Overman Co. have just now indications of a very promising character in the drift which is being run to the northward from the bottom of their engine shaft.

We understand that a deposit, the extent of which has not yet been determined, of very rich ore, was yesterday struck in the lower level of the Yellow Jacket mine. The exact character of the ore found, we have not yet learned, but it is said to be exceedingly good.

Gold Hill *News*, August 3d: The body of ore recently struck in the Yellow Jacket mine is 20 feet in width.

There was shipped from Wells, Fargo & Co's Gold Hill office, this morning, 17 sacks of bullion, weighing 1,506 pounds, and of the assayed value of $36,137.47.

Trespass, August 1st: The Crown Point is now sinking for the 1,000 foot level—100 feet deeper than the mine has yet been prospected. In order to do this, it becomes necessary to enlarge the reels sufficiently to hold the additional cable; and for this purpose the works will be shut down for one or two days next week.

We understand that the old hoisting works of the Yellow Jacket Co. will soon be started up, after an idleness of a month.

Dispatched from Wells, Fargo & Co's office in Virginia, this morning, 14 bars of bullion weighing 872 pounds, and worth $18,207.

NEW MEXICO.

A correspondent of the Santa Fe *Gazette*, of July 11th, writing from Pinos Altos, says: I am one of ten men who have organized the Gila River Ditch and Water Co. Our company have commenced the construction of a ditch to take the water from said river where it issues out of the Mongollon chain of mountains, and carry it to Grant City, to be used in running quartz mills, for manufacturing, etc. We have reason to believe that inside of five years a vast amount of quartz will be taken from the mountains near Grant City, and crushed by the water power we have secured.

I have just seen some quartz taken from the Langston lead at Pinos Altos, that is about half gold, and was informed that a large amount of just such quartz was taken out of a pocket in said lead, a few days ago. The Arizona Co. are working said lead with great success.

Denver *News*, July 15th: There were on the counter of the First National Bank this morning, five gold bars; aggregate weight 80.39 ounces, and worth at least $17 per oz. in coin. The finest was .899, and would coin not less than $17.50. It all came from the Cimarron.

OREGON.

Jacksonville *Sentinel*, August 1st: M. H. Chapin exhibited to us this week a nugget of gold taken from his claim on Pleasant Creek, which weighed 10¼ ounces. This is the second piece he has taken out this season. The first found weighed a dollar more than this piece.

The tunnel which Messrs. Fox, Patty & Co. had run into the hill channel at Waldo, in Josephine County, crushed the timbering and caved in lately. Where it broke, the ground was over 100 feet deep, and the opening at the top is about 50 feet across.

Artificial Granite.—A method of manufacturing artificial granite has just been patented by Mr. P. M. Parsons, of Blackheath, England, well known by his system of converting cast-iron guns into rifled ordnance. The materials of this artificial granite are disintegrated natural granite mixed with clay, together with pounded glass, lava, or iron slags. The disintegrated granite is obtained by submitting fragments of natural granite to a strong heat, about 700 deg. or 800 deg. Cent., in an oven, by which, after a sufficient time, it becomes dissolved into a granitic sand, the constituent parts of which, quartz or felspar, possess great powers of adhesion. One part of this granitic sand is then mixed with about an equal quantity of pounded glass, or the constituents of glass, or lava, or iron slag, to which is added from twenty to thirty parts of refractory clay, or from thirty to fifty parts of ordinary clay. This mixture is thoroughly kneaded together with a sufficient quantity of water to make it of a pasty consistency. It is then molded to any form required, and submitted to a degree of heat sufficient to vitrify the mass for about thirty-six hours, which converts it into a hard and durable substance resembling granite. The artificial granite thus produced may be molded into any forms required to render it suitable for various kinds of buildings, fortifications, docks, and other engineering structures, and particularly for all kinds of pavements, for which its great hardness renders it particularly suitable. When very large blocks are required, it is preferable to make them hollow, and after they have been baked or burnt, they may be filled with concrete, rubble, etc., to make them solid. Any kind of furnace in which the requisite heat can be generated will answer for dissolving the granite and baking or vitrifying the blocks or bricks; but Mr. Parsons finds that Hoffman's annular furnaces perform this operation satisfactorily. — *Mechanics' Magazine.*

Gold Mining in Russia.—Gold prospecting in Siberia is carried on after a somewhat singular plan. The mines are an object of much attention on the part of the Russian Government, and while it is opened free for any one to search for gold deposits in any part of the territory, the successful discoverer is obliged to report to the nearest government official, who apportions him a space of about four square miles, on condition that all the precious metal he obtains is to be carried to a government depot, where it is coined into money, the proceeds, less 15 per cent. for expenses, being then paid to the discoverer.

Mining and Scientific Press.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

Notice.—The partnership of C. W. M. Smith, W. B. Ewer and A. T. Dewey, has been dissolved this day by mutual consent. The Patent Agency and Newspaper Business of the MINING AND SCIENTIFIC PRESS will be continued under the firm-name of Dewey & Co., by A. T. Dewey and W. B Ewer.

San Francisco, August 1, 1868.

San Francisco:

Saturday Morning, Aug. 8, 1868.

REMOVAL.—Our friends will please bear in mind that the MINING AND SCIENTIFIC PRESS Office, Patent Agency and Job Printing Office has been removed from 505 to 414 Clay street, about half a block below Sansome.

Notices to Correspondents.

REFRIGERATOR.—Carbonic acid can be manufactured and stored in the liquid form for future use. The most convenient mode of obtaining it in this condition, is to employ two lengthy cylindrical vessels of iron, of great strength, with spherical ends. One is employed for the generation of the gas, the other is used as a receiver, in which the gas is accumulated. The generator being charged with a mixture of 2¾ pounds of bicarbonate soda and 6¼ pounds of warm water, a leaden or brass tube containing 1⅓ pounds of oil of vitriol is now cautionsly introduced, and the head of the apparatus, furnished with a stop-cock of peculiar construction, is screwed down and rendered tight by a leaden washer. The generator is then reversed, in order to mix the materials, by which means carbonic acid becomes liberated; the gas so set free will accumulate in the upper part of the vessel, where, by its own pressure, it becomes liquefied; a small tube is screwed on the side of each vessel, by means of which they can be connected. The second or receiving vessel is kept cool by being immersed in melting ice; a connection between the generator being made, and the stop-cocks opened, the liquefied gas distils over; after which the stop-cocks are closed and the vessels separated, whilst a fresh charge is being introduced into the generator. The operation may be repeated until the desired quantity of the liquefied gas has been obtained. Communicating with the stop-cock of the receiver is a tube which passes nearly down to the bottom of the vessel, and terminates in an open extremity, so that as soon as the stop-cock is opened, a jet of the liquid acid, by the pressure of its own vapor, is forced up this vertical tube, and escapes from the receiver through a fine nozzle, which is screwed to the stop-cock. The issuing liquid commences immediately to evaporate with great rapidity, in consequence of which so large an amount of latent heat is carried off in the escaping gas, that a portion of the liquid is converted into a solid form having the appearance of snow, if the operation is carried on with special precaution. When it is intended to manufacture liquid carbonic acid on a large scale, carbonate of lime, in place of soda, would be employed on account of the great difference in the cost of one of the main materials used.

R. L.—Very dilute sulphate of soda will precipitate barytes and strontium when in solution, but not lime, as the latter is soluble in about 420 times its own weight of water.

Causes Affecting the Values of Labor.

The extraordinary differences in the price paid for labor in different countries, is often spoken of, even by the most intelligent, as a matter of much surprise. The wonder that such a condition of things should exist is all the greater, from the fact that there should, at the same time, be found so small a comparative difference in the price of food—generally considered the basis of labor—in the different countries.

Previous to the labor disturbances growing out of the late war, the price of ordinary labor in the United States was about $1 per day, in gold. The same class of labor, however, could be commanded in England for seventy-five cents, while in the East Indies and China, labor could be had for from twelve down to even six cents per day.

A given quantity of flour or rice—the first the chief article of diet of the American and European, and the latter of the Asiatic—contains about an equal amount of those substances, which, when taken into the stomach produce impulses of physical force. True, the American or European may consume a greater quantity of food than the Asiatic. Still the general truth must be admitted; and that admission renders the fact an interesting subject for investigation, to the end that we may determine the cause of the remarkable difference in wages between the two extremes, while the use of food is so nearly the same and its cost so nearly equal that the country which pays the highest rate of wages, can afford to send flour to the one which pays the lowest rates.

In the ordinary consideration of this subject a most important condition is often omitted, viz.:—the possession of a greater degree of directing intelligence on the part of the one than the other.

If, in estimating the price of wages, we take into consideration an element of power which exists; but in a form quite distinct from mere physical force, viz.:—a knowledge of the most effective modes of rendering physical force most advantageously available, we may find a valid reason for a large portion, if not the entire difference between the prices of labor in the extreme localities named. By combining the comparatively feeble power of man with a general knowledge and practical application of the principles of mechanics, the result of a day's labor may be augmented, in many cases a hundred fold or more. Hence it follows, as a necessary consequence, that in estimating the comparative average value of the labor of people, this important combination of knowledge with power must be fully taken into consideration.

In the labors of agriculture an inhabitant of China, or one of the less civilized islands of the Pacific ocean, will exert the same amount of physical power in the use of his rude implements, as the laborer in the United States or England does with his steam plow, planter or thresher. The same amount of food—of carbon and hydrogen, burned within the lungs—produces a corresponding amount of physical force, whether taken into the stomach of the American or an Asiatic; but the combination of the more effective power of the horse or the steam engine, exerted through properly devised machinery, and simply directed by the human being, stamps a many fold value upon the labor of the one over that of the other; and enables the farmer who pays a dollar a day for labor, to feed at a profit, many thousand miles away, those who are laboring for ten cents a day to raise the same articles of food. This fact is still more apparent when applied to manufactures, and the contrast may be extended through every branch of human industry.

One word further with regard to the price of wages. They are high or low, not according as the sums paid are large or small, but according to what those sums will purchase. If a mechanic receives $2 a day and pays $10 for a barrel of flour, and at the same rate for all other things, he is no better off than when he received $1 for his labor, and bought flour for $5 per barrel, and other things at the same reduced value.

It is among the chief duties of journalists to advocate the interests of the laboring classes; for it is honest and intelligent labor, more than all other things combined, that gives material prosperity to a country. It is the hands that toil at the loom, that direct the various engines of industry, build, delve and are honorably hardened by contact with some implement of labor, that uphold the fabric of communities, and make nations prosperous, wealthy and powerful. But to be successful and useful, above the laborers of half civilized countries, the workman must be skillful and intelligent, and capable of fulfilling the true aim of the physical power existing in the human being. Such intelligence renders powerless the tyranny of capital—for the labor of coöperating masses is but another form of capital, which may always be brought to bear when legitimate capital is unmindful of its obligations. When society fails in its duty in this respect, educated labor—labor, capable of directing itself,—is abundantly able to protect itself.

But we are being led away from our original purpose, which was merely to invite the attention of our readers to a consideration of the true causes affecting the values of labor. We have shown that labor is valuable only in proportion to the intelligence which directs it, and we have hinted at the manner in which intelligent labor may always protect itself, in an orderly way, and by means which never need interfere with any one. "Strikes" should be left to those who lack the intelligence to give the proper value to their labor, and when those who engage in them interfere with the public peace and quiet, all good men should frown upon them. Coöperation is open to intelligence everywhere; and in a country, where education is free to all, he who neglects his advantage must expect to suffer the consequences. The man who has neglected the opportunities to cultivate those capacities which will enable him to join in coöperative associations, ought not to expect a preference in the price of his labor over those who, never having enjoyed those opportunities, willingly rate their labor cheap in consequence.

PERMANENCY OF MINING.—Perhaps the best evidence of the permenancy of the mines of the precious metals may be found in the fact that, after more than three or four centuries of operation, more or less active, the silver mines of Mexico remain as her greatest industrial resource, the basis of her commerce, and the best security she can offer for the cost of any improvement she may contemplate.

THE peat speculation, which excited such a furor in the Eastern and Middle States some year or two ago, seems to have turned out rather disastrously. The Hartford *Times*, speaking of the result in Connecticut, says: "Losses have occurred in this and Tolland counties to the extent of about $150,000 in this speculation, and large sums in other parts of the State."

SILK WORM EGGS.—Messrs. Hoag & Haynie, of Sacramento, the great silk-worm men, expect to sell from 800 to 1,000 ounces of eggs this season, most of which will go to Europe, where the California eggs are in great demand on account of the healthy worms which they produce. These eggs are worth about $5 per ounce.

THE English prejudice against anthracite has become so completely broken down that orders have been issued that henceforth none but anthracite coal is to be used in the British navy.

The first regular issue of the 3d volume of the DAILY FAIR PRESS, will be made in the Pavilion on Monday evening next.

The Mechanics' Institute Fair.

The opening of the Exhibition having been advertised for to-day (Saturday) we have made a visit to the grounds before going to press, and an inspiring sight we saw: the tasteful brown redwood structure with its towers and extensive wings rising up now in their full finished proportions, the broad front entrance thrown open, numerous buggies standing in waiting, the ticket offices in full blast; but not till getting a glimpse of the inside was the true spirit of the scene presented to us. The effect of the great semi-circular arches supporting the roof, and of the timbering overhead in general, was enriched by the beautiful natural color of the redwood, and the architecture throughout, though simple and economical in execution, is artistic, and will strike every visitor agreeably. There was the din of all the arts and trades combined, echoing through the entire space within; there was hammering and sawing, and shoving and hauling, and rushing about, and calling, by the hundreds of exhibitors who were enthusiastically at work with all the help that could be crowded into their respective spaces, in putting to rights the cases and masterpieces to be exhibited. It seemed as if all the industry of California were then and there concentrated—and so it was, indeed, representatively, for it is well understood that the live people of the State are taking an unusual interest in this year's exhibition. From the galleries we heard the echo and tramp of some 500 school boys, who were marshaled and marched around the circuit by their instructors to witness, very appropriately, and be benefited by, the inspirations of such an occasion and place. There they saw, springing up under their wondering eyes, a little industrial world, as if by magic. We cannot particularize as to the fountains and other innumerable splendid things we caught sight of—but the reader can well imagine it all as it will be by about Wednesday or Thursday next, with crowds of joyous men and women wandering through the mazes to strains of music. The Art Gallery will be quite a feature.

The cool breezes of the Bay City, in connection with this Exhibition of the advancement of our arts and trades, and of the new things which individual enterprise has furnished in the way of supplying the demands of a Commonwealth, which we believe is to have a great history, will bring into our midst, this week, a very large number of the substantial and influential citizens of the interior, as well as from Nevada and from Oregon, who will profit by each others society, and be made wide awake to the significance of the times. How can we overlook the great events between which this exhibition rises into an historic position, as an index and centre—the establishment of railroad and steam communications between the "old and the new," and the making available for our advantage, of the labor and resources of China?

It is expected that the pavilion will be visited daily by from three to ten thousand people. The opening takes place, as promised, this day at 11, A. M., notwithstanding some strong efforts which were made to defer it to enable the exhibitors to arrange things more satisfactorily for the first day. All who can should be present to hear the address of Newton Booth.

NOTHING NEW.—It is claimed that evidences have been discovered that the *magnetic telegraph* was a thing conceived of more than two thousand years ago. In an ancient Italian work, published in 1636, it appears that a Dutch savant had written of the possibility of establishing secret correspondence between Italy and Holland by the aid of needles. [magnetic?] Madame du Deffend, in a letter written and published about the same time, also alludes to the same subject.

The Pacific Saw Manufacturing Co.

Prominent among the new industrial enterprises which have recently been established in this city, stands that whose title we have placed at the head of this article. The company was organized about two years since, on a very limited scale, and started their works at Nos. 113 and 115 Pine street; it consisted of the present proprietors, C. P. Sheffield, N. W. Spaulding and James Pattison. It has gradually grown from small beginnings to a large and most important industrial enterprise, and has now stepped the importation of saws to this coast to the value of from $40,000 to $50,000 per year.

On the 1st of July last the company moved their works from Pine street to their new brick building, 17 and 19 Fremont street, where they now employ about thirty-five hands. The new works occupy three floors, covering the entire area of a full-sized water lot. The machinery of these works is driven by an engine of 30-horse-power. Every class of saw—circular, mulay, cross-cut, carpenters' saws of every kind, butchers' saws, etc.,—is made at this establishment, which is the only one of the kind on the Pacific Coast.

California has led off in the use of large circular saws for the manufacture of lumber—the demand for their employment growing out of the extraordinary size of the timber which is found on this coast. As the size of the saws increased, a corresponding care was required in the process of their manufacture, in order to secure a perfectly true run and rapid feed. The Pacific Saw Manufacturing Company, in order to secure this important desideratum, have procured the most complete and perfect class of machinery for every department of the work of manufacture. A recent visit to this establishment and careful examination of all its parts, quite surprised us at the extent, character and perfection of the machinery employed; and we have thought that a brief description of the same would not be without interest to our readers.

The raw material is imported direct from England for this manufactory, and from the well known house of Jesop & Sons, Sheffield. It consists of the best cast steel that can be produced. That for circular saws is received cut into disks, corresponding to the size of the saws to be made. The material for all the other large saws comes cut in the rough, to the shape of the saw which is to be produced. When received, the plate is extremely uneven, warped, and as unlike the beautiful polished plate of a finished saw as such a thing could be well made. The first process is to cut the teeth, which is done by means of dies, indexes, presses, etc., worked by steam. The plate is then "flattened" to an approximation to a perfect plane. This is accompanied by hammering the same on an anvil block, and by the most skillful workmen. The plate is then placed in a large oven or furnace, eight by twelve feet in dimensions. Great care is taken in this heating process, both in the character of the fuel employed, and in the manner of the application of the heat. The plate is removed from this oven and plunged into a bath of prepared liquid, the precise composition of which is one of the secrets of the art.

The art of tempering is a most important one, and requires much experience and care. The rule at this establishment, in the case of cross-cut saws, which are branded "extra," is to require them to be bent into circles of two feet in diameter. If they break in this operation or fail to fly back to their original shape, they are either condemned entirely, or marked as inferior saws, and sold at corresponding prices. It is especially important, in tempering, to have a uniform state of the atmosphere, as the exposure of the plate to too great a degree of cold in passing it to and from the bath, seriously affects the temper. The uniformity of the climate of this city is peculiarly favorable for this part of the work. After tempering, the saw is again straightened to remove any twists which it may have received in that process. It is now nothing but a black, rough, unburnished plate. The first process of "finishing" is to grind this surface by passing it between large revolving stones, which rapidly remove the rougbness and give it a partial polish. The grinding of mulay and crosscut saws is a very simple process; but the machinery required for holding a large circular saw to the stone, and securing a true and even grinding of its surface, is quite a complicated affair: yet it handles one of the largest size circular saw plates with all the ease of a child handling a toy. Its work is extremely rapid and perfect. From the grinders the plates pass to be "blocked,"—that is, hammered lightly on a perfectly smooth anvil block, and in such a manner as not to draw or otherwise injure the temper or face of the steel. This process is exceedingly tedious, and one which requires the greatest patience and care, and the most perfect eye; as upon the accurate performance of this work depends the future running of the saw.

From the blocks the plate is again sent back to the furnace to be "stiffened." It is now ready for the polishing room. Here the plates go through various operations of polishing by emery wheels, aided by machinery suited to the different classes of saws which are being operated on.

Saws are made by this company with both fixed and movable teeth. The process of the manufacture of the movable teeth, although carried on at this establishment, is a separate business from that which we have described, and belongs exclusively to Mr. Spaulding, one of the company, and a mechanic who has done more than any other man for the improvement of circular saws. His movable teeth have, in fact, almost revolutionized the business, adding largely to the capacity for doing work and greatly decreasing the cost of the same. Mr. S. was the first to make any improvement in the movable teeth, by which it has become possible to bring them into general use. We shall give a more particular description of this branch of the business in our next issue.

FIVE HUNDRED AND SEVEN MECHANICAL MOVEMENTS: By Henry T. Brown, editor of the *American Artisan*, N. Y.

We have just received this little work which contains, in a neat form, the largest and most comprehensive list of mechanical movements ever published, and it will prove invaluable to mechanics and inventors for reference.

In selecting the movements, both American and foreign works have been consulted, and the best selected, but not more than one-fourth of them are entirely new, never having appeared before in any work. The engravings and description are arranged on opposite pages, which, with a copious index, makes the book the most convenient for reference we have ever seen.

It should have a wide circulation, and if consulted, will save many an inventor weeks or months of labor in perfecting some invention, which, when finished, be discovers to be an old and common device.

WANTED—At this office, the postoffice address of Enraght Massey, late of Gold Hill, Nevada.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 113 Sutter street, Lick House Block, San Francisco. 6v16-aim

---

BY MAIL.—The *Mining and Scientific Press* will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sen accordingly.

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Paint will not remove in five minutes. Whether a frightful Burn, a griping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers, or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc.; sold by all druggists.

G. H. MOORE, Inventor and Sole Proprietor, 642 Market street, San Francisco, Cal. 21v16-3m

---

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

☞TO THE PUBLIC.☜

Hear what Bussey has got to say in defence of his Lock:

WHEREAS, Certain parties in San Francisco and elsewhere, are conniving to destroy the reputation of the Bussey Lock, in order to establish other Locks in which they are interested; and

WHEREAS, It is asserted that a certain individual now in this city will put up $5,000 against the same amount, that he can pick the Bussey Lock in eight hours' time; but makes Bussey this generous proposition: That he does not wish to injure him in any way, and if he will pay a certain amount of money the Lock will not be exposed. Wants Money, is in the market at the highest bidder!

Now Bussey wishes it distinctly understood that he pays no man to keep quiet. Bussey's Improved Combination Lock will be on exhibition at the Mechanics' Fair, in competition with other Locks for the First Premium, and a challenge will be given then and there, to the world in general, and H. S. Folger in particular. The security of the Lock will be endorsed in any amount, from $500 to $30,000. The man presuming to pick it will be required to endorse his skill in a corresponding amount.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Silver Mining in West Virginia.

Two or three years ago considerable was said about some discoveries of silver in Jackson County, West Virginia, by parties engaged in boring for oil. These discoveries, we believe, were pretty generally discredited at the time, and we had supposed that the idea of mining for silver in such connection was soon abandoned. It appears, however, that such was not the case; but that considerable energy and much capital is now being expended, with the view of developing these supposed silver mines. The "mines" appear to be spread over quite a large space, judging from the fact that the "indications" have been struck by so many different parties, as given below. A local journal gives the following brief history of these workings:

Shortly after the war, two young gentlemen by the name of Cunningham, while boring for oil, struck a substance of a bright argentiferous appearance, which at first attracted but little attention. They, however, saved some of the material and sent it to Philadelphia to be analyzed by competent chemists, who pronounced it to be silver of a very fine quality. This created some considerable excitement, which induced other companies to prospect for the metal. In less than one year fifteen companies had sunk holes to the depth which the metal was represented to be, and fourteen out of the fifteen obtained the precious metal. Thus encouraged, two companies, the Pittsburg Mining and Developing Company and the Pomeroy Company, undertook the task of sinking shafts six by twelve feet to the depth of 390 feet. These companies have patiently labored for nearly a year in driving these shafts. The Pomeroy Company has descended to the depth of 185 feet, the Pittsburg Company to the depth of 335 feet. The Pittsburg Company has still 55 feet to go before it reaches the gaol for which it is laboring. If the latter Company has no bad luck it will be down to the region of the precious metal by the 1st of June. The following are the depths at which the silver has been struck by different companies: The Pittsburg Exploring and Mining Company at the depth of 372 feet and 342 feet; the Mason County Silver Company at the depth of 384 feet; the Mason City Company at the depth of 260 feet; the first Pomcry Company at the depth of 366 feet; also, at another place, at the depth of 374 feet; the second Pomeroy Company at the depth of 386 feet; Ohlinger, Milton Company, at the depth of 382 feet; the Philadelphia Company at the depth of 396 feet. The President of the Pittsburg Company has sent some specimens of the metallic silver brought out of their bore hole to Mr. Otto Wuth, analytical and consulting chemist in Pittsburg, and he found them to be—

Silver	80.89
Lead	9.58
Copper	8.68
Gold	0.40
Iron	0.81
	100.00

Mr. Grimm, President of the first Pomeroy Company, sent also some specimens to be analyzed by Dr. Wayne, a practical chemist and mineralogist, who found them to be—

Silver	94.00
Copper	6.00

The other companies have had their specimens analyzed, and none came under 80 per cent. of pure silver.

"CHECKING" RAILWAY CONDUCTORS.—The Street Railway Company of Chicago furnishes each conductor, on each trip, with a long card, upon which are printed, commencing with a star, which is to be punched first, the numbers 6, 12, 18, 24, and so on up to the amount of 50 cash faree, so that the number next to the last hole punched will represent the amount received on any one trip for full cash fares. These the conductor is required to carry, and as often as a fare is paid in money to punch it in the presence of the passenger. For fractional and short fares he is required to make a mark on the back of the card, and when the card is given to the conductor he is held responsible for its return, being charged with its full amount in case of its loss. By this means it is believed that his honesty will be insured.

A COAT of gum-opal varnish applied to the soles of boots and shoes, and repeated as it dries, until the pores are filled and the surface shines like polished mahogany, will make the soles water-proof, and also cause them to last three times as long as ordinary soles.

PHILOSOPHY OF STREET WATERING.—Mr. J. W. Ceepor, has recently patented an improved system of watering streets, which is being tried in the parish of St. Marylebone and elsewhere, and promises to be successful. He introduces into the ordinary carts, when charged with water, a mixture, in suitable proportions, of fused chloride of calcium and chloride of sodium (common table salt). These salts, as is well known, are highly deliquescent, especially the chloride of calcium. When such a solution is applied to the roads, the retention of moisture by the chlorides serves to keep them in a damp condition for a much longer period than when ordinary water is used.

By the present system of *deluging*, three applications daily are scarcely sufficient in warm dry weather to prevent the dust from blowing, whereas *one* application of Mr. Coopor's composition at intervals of two or three days will, it is said, effectually accomplish this object, and at a much less cost.

The dust in the large rooms of warehouses and similar buildings might, doubtless, be effectively controlled by adding a little of these salts to the water used.

SCULLS VERSUS OARS.—During a late discussion on the slip of screw-propellers, at the Institution of Naval Architects, London, the chairman, Vice-Admiral Belcher, incidentally said he wanted to know how it was that a Japanese vessel of 65 or 70 tons, pulling against his 36-ton gig, with 18-foot oars, beat them out-and-out with two sculls? There were four men at each scull, the sculls being in the direction of the axis of the vessel. The sculls drove the Japanese vessel ahead faster than his gig could follow. The distance the scull passed through the water could not have been above six or eight inches, and it was only the bend of the oar which gave diagonal jerk to the vessel.

The question was not there answered, but it is evident the Japanese scullers had an advantage in an almost continuous application of their power. In Venice, the gondola is often driven by a single scull, held, not behind, but on the side of the vessel, and worked to the right and left, without being raised from the water. Thus, the expert gondolier propels and steers his craft with the same paddle.

CEMENT FOR ATTACHING GLASS AND BRASS.—A resin soap is first formed by boiling three parts of resin and one part of caustic soda in five parts of water, and then mixing this with half its weight of plaster of paris. This cement is said to be impervious to petroleum, only superficially affected by water, to adhere very strongly, and to be a bad conductor of heat.

UTILIZATION OF BRAN.—A process has recently been patented in England by which the bran of flour after being separated is ground into an impalpable powder, and then again mixed with the flour. In this way all the nutritious ingredients are preserved, while the fineness of the flour is not affected.

PREMATURE DECAY OF THE TEETH.—A London surgeon thinks he has discovered the cause of the premature decay of the permanent teeth. It is for want of the stimulus of pressure on the socket owing to the universal practice of rendering the food soft by the abomination of cooking. His remedy is the common use of navy biscuit or "hard tack," instead of bread.

THE COTTON CROP.—It is estimated that the cotton crop for the current year will reach 2,200,000 bales.

Cyanide of Potassium.
Messrs. Falkenau & Hanks—Gentlemen:—I have, in the last year's experience in milling gold ores, had occasion to examine, with care, the effects of the Cyanide of Potassium in promoting amalgamation. I am bound to say, as the result of my observations and experience, that it is a most powerful agent in amalgamation. With its aid and that of a little sodium and amalgam, copper plates are immediately mercurialized with ease and certainty, and the effects of nitric acid entirely avoided. The solvent power of Cyanide of Potassium on metallic oxides is well known to chemists, and its effects in brightening the dull surface of unhealthy copper in mill sluices is something wonderful to witness. Opinions are divided among amalgamators as to the durability of this effect, as compared with the ordinary mode of treatment by the brush, etc.; but my own judgment points clearly to the remarkable power as being a subject well worthy of the careful and candid examination of all who have an interest in the management of gold quartz mines. Of its efficiency and usefulness in pan workings no one, I believe, entertains a doubt.
Yours truly, PROF. B. SILLIMAN.

ARE THE
Fashionable Clothiers
OF
San Francisco.
SPECIALTIES.
PRICE AND GUARANTEE.
The largest and most varied stock of Gentlemen's Clothing, Furnishing Goods, Trunks, Bags and Valises, on the Pacific Coast. Every article sold, being of our own manufacture, is guaranteed. Having contracts direct with European and American manufacturers of piece goods, we thereby effect a saving of fully 50 per cent. in wholesale dealers' profits, and are thus able to offer superior goods at less than second-rate prices.
STYLES.
Having agents in London and Paris, we introduce the new styles in San Francisco simultaneously with their appearance in New York.
GOODS MADE TO ORDER.
For the accommodation of such as may desire, we have secured the services of a celebrated European cutter, and are prepared to make up piece goods in a style superior to any other house on the coast. Shirts, Ties, Collars, etc., made to order at short notice.
COUNTRY ORDERS.
Goods forwarded by Express to any part of the Pacific Coast on receipt of orders and measures; send for directions for measurement.

Pioneer Screen Works,
JOHN W. QUICK, Manufacturer,
Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.
N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the Mechanics' Institute Fair, will please call and see me. 5v17-1y

Mining Secretary.
THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.
Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

KAOLIN I NEVADA.—The Reese River *Reveille* is informed that an extensive bed of Kaolin in porcelain clay, has been discovered at Mount Tenabo, in the district of Cortez. It was recently discovered in the workings of the Garrison mine, and the specimens exhibited have been pronounced very fine by competent judges. The peculiar clay results from the decomposition of feldspar; the change consisting in a removal of the alkali, potash, with part of the silica, and the addition of water. It occurs in extensive beds in many granite regions, and is the material used for making chinaware.

THE Chinese were the first to attempt to measure time. According to their historical books, the Emperor Fohi, who lived 2,952 years before the commencement of our era, stndied the celestial bodies with great attention. The idea of dividing the day into equal parts by means of the sun's dinrnal motion is very ancient, and the first contrivance of the kind probably consisted in sticking a spear into a plane surface.

THE GOLD MINES OF NEW HAMPSHIRE. We see it stated that Professor Hitchcock proposes to visit the gold mines of New Hampshire the coming fall, and give the pnblic the resnlt of his investigations. Anything which that gentleman may publish on the snbject will no doubt be reliable, and will be read with much interest.

A LUSUS NATURÆ.—A perfectly formed ear of corn, which had grown in the tassel of the plant, was exhibited at a late meeting of the Farmers' Club of the Mechanics' Institute, N. Y. From the complete manner in which the kernels covered the cob the curiosity was considered a most interesting example of a *lusus naturæ*.

THE LATEST IMPROVEMENT
In Dentistry.

PATENTED DECEMBER 3d, 1867, by DR. G. W. COOL. The right of San Francisco reserved for his own use. The nature of his improvement consists in lining the entire concave surface with fine gold; it makes the plate twice as strong and one-third thinner than the common vulcanite plate. This work has given satisfaction in every case. Please call at No. 14 Third street, near Market, and see specimens. All work warranted as fine as the specimens. Prices reasonable. 21v16-3m

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.
LEAVE WHARF, CORNER OF FIRST AND

Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK:
On the 6th, 14th, 22d and 30th of every month.
Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.
Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.
Departure of 14th is expected to connect with English steamer for Southampton and South America, and Anstralia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained..
STEAMERS FOR AUGUST, 1868.
The following Steamships will be dispatched on dates as given below:
August 6th—SACRAMENTO.....Capt. Wm. H. Parker, Connecting with ALASKA, Capt. Gray.
August 14th—MONTANA.....Capt. J. M. Cavarly, Connecting with OCEAN QUEEN, Capt. King.
August 22d—CONSTITUTION.....Capt. C. C. Comstock, Connecting with RISING STAR, Capt. Conner.
August 29th—COLORADO.....Captain W. F. Lapidge. Connecting with ARIZONA, Capt. Maury.
Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.
An experienced Surgeon on board. Medicine and attendance free.
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.
Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of $40 to $20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.
The Steamship JAPAN, Capt. Geo. E. Lane, will be dispatched on MONDAY, August 3d, at 12 o'clock, noon, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting with the COSTA RICA for SHANGHAI.
For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.
For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.
OLIVER ELDRIDGE, Agent.

A TREATISE

—ON—

CONCENTRATION

OF ALL KINDS OF ORES;

INCLUDING THE

CHLORINATION PROCESS

For Gold-Bearing Sulphurets, Arsenlurets, and Gold and Silver Ores Generally.

BY GUIDO KUSTEL,

Mining Engineer and Metallurgist, Author of "Nevada and California Processes of Silver and Gold Extraction."

With 120 Diagrams on 7 Plates.

CONTENTS:

I.—INTRODUCTION.

1. *The Dressing.*—Dressing of Ores; Principles of Dressing; Division of Dressing.

2. *The Separation.*—Separation of Gangue from Ore in the Mine; Dressing of Ores outside the Mine; Separation by Hammers; The Ragging; The Spalling; The Cobbing; Separation by Hand; The Picking.

3. *Cleansing and Sizing Contrivances.*—Washing and Sizing; Stationary Apparatus; The Sluice; The Kila; The Step Sluice; Movable Machines; The Hand Riddle; The Rocker; The Circular Hand Riddle; Swinging and Jurring Riddles; The Jarring Riddle.

4. *Rotary Sizers.*—The Trommel or Drum; Cylindric Trommel; Prismatic Trommel; Conical Trommel; Combined Trommel; The Sifting Wheel; Sizes of Grains for Jigging.

II.—REDUCTION.

1. *Reduction of Ores.*—Reduction of Ores to a Proper Size; Breaking under Heavy Stamps; Reduction by Rock Breakers; Hanscom's Crusher; Blake's Quartz Breaker; Reduction by Stamps.

2. *Description of Batteries.*—The Foundation; Mortar Blocks; Frames; Iron Frames; Hewland's Rotary Battery; The Straight Iron Battery; Bryant's Battery; Wright's Iron Battery.

3. *Details of a Battery.*—The Mortar; Stem or Lifter; Shoe or Pestle; Socket or Head; Tuppet; California Tuppet; Cams—Wooden Cams; Iron Cams.

4. *Speed, Curve and Order of Lifts.*—Limit of Speed in Crushing; Construction of the Cam Curve; Order of Successive Stamp Lifts; Hanging-up of Stamps.

5. *The Discharge of Batteries.*—The Discharge in Dry Crushing—with Grates; without Grates; with Sieves; Dust Chambers; The Discharge in Wet Crushing—the Grates and Screens.

6. *Feeding of Batteries.*—Hand-Feeding; Stationary Hoppers; Movable Hoppers; Quantity of Water for Crushing; Remarks on Speed and Weight of Stamps.

7. *Reduction by Rolling Mills.*—Construction of Rollers; The Frame; Feeding of Rollers; Remarks.

8. *Grinding.*—The Arastra or Tehama; The Edge or Chili Mill; Ball Mills; Lundgren's Pulverizer; Cylinder Mills; Ferrand Mill; Hepkins' Grinder; Horizontal Mills; Iron Pan Grinders.

9. *Pans with Plane Mullers.*—The Common Pan Grinders; Tub Grinder; Bartole's Grinder; Knex's Pan; Varney's Pan; Wheeler's Pan; Union Grinder; Moore's Quartz Grinder; Gaston's Grinder.

10. *Pans with Conical Mullers.*—Hepburn & Petersen's Pan; Belden's Pan; Baux & Guied's Grinder.

11. *Pans with Tractory-Conical Mullers.*—Excelsier Pan; Wheeler & Randall's Pan; Excelsior Continuous Grinders.

12. *Pans with Perpendicular Mullers.*—The Centrifugal Ore Grinder; Varney's Quartz Grinder.

III.—CONCENTRATION.

Concentration of Reduced Ore.—Division.

A. *Concentration of Ore Grains, (Jigging Stuff.)* The Principle; The Jigging.

2. *Movable Jiggers.*—The Movable Jigger.

3.—*Stationary Jiggers.*—Hydraulic Jigger; Pethcrick's Separater; Stationary Jigger.

4.—*Continual Jiggers.*—Percussion Jigger (Setz-Herd); Continual Cylinder Jigger; Continual Jigger; Hydraulic Continual.

5. *Rotary Machines.*—The Rotating Cylinder (Strem-setz Maschine); Rotating Wheel (Setz-Rad); The Dolly Tub; Auferman's Dry Jigger.

B. *Concentration of Ore Sands and Slimes*

6. *Assorting of Sands.*—The Labyriath; Berlace's Slime Separater; Ph. Hefmaan's Separator; Rittinger's Funnel or Pointed Box; Rittinger's Spitz-Lutte.

7. *Feeding of Concentrator.*—Feeding Boxes; Stationary Feed-Box; Rotating Feeder.

8. *Stationary Concentrators.*—Hand Buddle; Sleeping Table; Rack; Sweeping Tables; Round Buddle; Concave Buddle; Blanket Tables.

9. *Percussion Tables.*—Percussion Tables; German Percussion Table; Continual Percussion Table; Hunter's Continual Percussion Table; Varney's Percussion Buddle.

10. *Oscillating and Shaking Tables.*—Borlace's Concentrator; Hendy's Concentrater; Hungerford's Concentrater; Barren's Concentrater.

11. *Steady Moving Concentrators.*—Steady Moving Concentrators; Concave Rotary Buddle; Convex Rotary Buddle; Burten's Table; Self-Discharging Blankets; Horizontal Moving Blanket.

IV.—SPECIAL CONCENTRATION.

1. *Concentration of Gold Ores.*—Concentration of Gold Ores; Amalgam of Gold Quartz; Amalgamation and Grinding; Combined Concentration and Amalgamation; Treatment of Concentrated Stuff.

2. *Concentration of Silver Ores.*—Concentration of Silver Ores; Concentration Works; Cost of Concentration; Concentration of Tailings.

3. *Concentration of Lead and other Ores.*—Concentration of Lead, Copper and other Ores; Value of Ores for Concentration.

V.—CHLORINATION.

Extraction of Gold from Sulphurets or Arsenicals by Chlorination; Assay of Gold Sulphurets by Chlorination; Chlorination Process for Sulphurets; Loss of Gold in Roasting; Single Roasting Furnaces; Double Furnaces; Mechanical Furnaces; The Roasting Operation; Roasting with Salt.

Chlorination.—Dumping of the Roasted Ore; Sifting; Production of Chlorine Gas; Lixiviation; The Precipitating Vat; The Precipitation; Cost of the Chlorination Process per ton of Ore; Remarks.

Other Methods of Dissolving and Precipitating the Gold from Sulphurets.—Chlorination at Reichenstein; Chlorination at Schemnitz; Calvert's Method for Auriferous Quartz; Extraction of Gold, Silver and Copper.

PRICE ..... $7.50 per copy.

Sent by mail, and sold wholesale and retail, by DEWEY & CO., publishers, office MINING AND SCIENTIFIC PRESS, San Francisco.

MANAGERS OF THE FAIR.—The list of Officers above enumerated constitute the Board of Managers of the Sixth Industrial Fair of 1868,

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable pawder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

BLAKE'S QUARTZ BREAKER!

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,
8v13-1y Stove Store, No. 125 Clay street, below Davis.

REMOVAL.

E. O. HUNT'S

Manufactory of
Windmills, Horse-Powers and Pumps,

Has been removed from the old stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of Mission st., San Francisco.

Hunt's Patent Wind-Mills, Tread Horse-Powers, Sweep Horse-Powers, (for one or four horses), Sawing Machines, Pumps of all kinds for shallow or deep wells, including Hunt's Submerged Pump, Hunt's Globe Pump, and Hunt's Single and Double-Acting Pump.

Pumping Machines and general Machinery kept constantly on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

23v16 **E. O. HUNT, Proprietor.**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

Brodie's Patented Improvements

FOR THE TREATMENT OF
Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

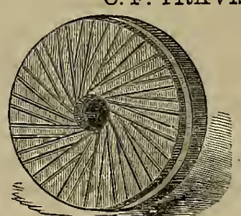
No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... **$600**

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... **850**

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... **1,200**

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.



A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

The Early History of the New Almaden Quicksilver Mines.

The following early account of the New Almaden quicksilver mine, condensed from an article in *Silliman's Journal* for September, 1848, may not be uninteresting at this time:

The mine of New Almaden is situated a few miles from the coast, about midway between San Francisco and Monterey, and in one of the ridges of Sierra Azul Mountain. The mouth of the mine is a few yards down from the summit of the highest hill that has yet been found to contain quicksilver, and is about 1,200 feet above the neighboring plain, and not much more above the ocean.

This mine, known to the aborigines from time immemorial as a "cave of red earth," from which they obtained paint for their bodies, was first discovered to contain quicksilver about four years since, during experiments made by some Mexicans to smelt the ore for the purpose of obtaining gold, which they supposed it to contain. About two years ago it fell into the hands of Barron, Forbes & Co., who sent on hands, tools and funds to commence working it. Unfortunately the vessel fell into the hands of the United States forces, and was confiscated; the operations of the mine were of course delayed till the arrival of Mr. Forbes himself a few months since, with miners, tools, and whatever things he was able to procure in Mexico, to enable him to make a fair experiment on the capabilities of the mine. The great trouble was to obtain suitable apparatus for extracting the ore. At length *four potash kettles were found*, which were set in a furnace of adobes, with condensers of mason-work immediately adjacent—a wretched apparatus indeed for managing so subtle a thing as mercurial vapor. The mode of working was to fill each of these pots in the morning with 400 pounds of the ores of average quality, broken in lumps of the size of apples, put on the covers and *lute* them with clay. The fires were then kept up till near night, when the furnaces were allowed to cool gradually. The next morning the condensers were opened, and the metal dipped up; which usually amounted to from 200 to 300 pounds for the four pots. This was a much less percentage than the assay indicated, and it was obvious that a large portion of metal was lost. The upper parts of the pots and condensers were found to be generally coated with a crust of sulphuret of mercury. Mr. Forbes wished to devise some way of extracting the metal without mixing lime with the ore in the roasting, but was unsuccessful. At length a kiln of lime, which occurs in the immediate vicinity, was burned, and mingled with this, the ores yielding a vastly larger percentage of metal. In the last three weeks about 10,000 pounds of metal have been extracted with the same apparatus, being a yield of over 50 per cent. Whether the ores were picked or not the writer cannot say, but presume they were. Between 15,000 and 20,000 pounds have been extracted in about two months, only six miners having been employed in digging the ore, and the hands of the establishment, all told, miners, furnace-men, wood choppers, etc., etc., numbering only a score. The mine is probably yielding a net profit of $100,000 a year with its present crude apparatus. With suitable furnaces and iron cylinders or retorts, the mine would easily yield $1,000,000 and upwards. Mr. Forbes sails to Europe shortly for the apparatus necessary. The bed has as yet been followed but a few hundred feet, but the ores grow more and more rich and abundant.

The other mines opened in the vicinity have not yet been sufficiently developed to decide upon their character. Ore has been found in fifteen or twenty other places within a few miles around, and within a few days in hills that do not seem to belong to the same range with that which contains the mine already described.

Some ores of silver have also been recently discovered in this region; but I have had no opportunity of procuring any genuine specimens as yet, and whether silver mines worth the working will be found is at least problematical.

There are traces of coal in the country, but nothing of value has yet been discovered.

Gold has been found recently on the Sacramento, near Sutter's Fort. It occurs in small masses in the sands of a new millrace, and is said to promise well.

OLD FOLKS.—Oliver Wendell Holmes says that a man over ninety is a great comfort to his elderly neighbors. He is a picket-guard on the extreme outposts, and young folks of sixty or seventy feel that the enemy must get by him before they can come near their encampment.

A Paint for Stoves and Ovens.—Blacklead is a great institution for polishing stoves, and probably few but cooks and housemaids would care to see its use diminished. It certainly has its recommendations, but it can hardly be said to be ornamental, while it entails an immense amount of labor. In Germany, where a stove and sort of kitchen range is continually to be found in the common sitting-room of a respectable family, the unsightliness seems to have been felt, and a suggestion has been made to do away with the black-lead and paint the stoves and ovens. Oil paint, of course, cannot be employed, but waterglass (silicate of potash) colored with pigment to match the paint of the apartment is the material recommended. Before this is applied the iron must be thoroughly cleaned from grease, and all rust spots must be rubbed off with a scratch brush. Two or three coats of the paint may then be put on and allowed to dry, after which the fire may lighted without fear of injury to the color, which may, indeed, be heated to redness. Grease or milk spilt over the paint has no effect upon it, and it may be kept clean by washing with soap and water. Dutch-ovens and like utensils may also be coated with the same materials, and the labor spent in polishing be saved. A good coating of the paint, it is said, will last a year or two.

Alcohol as it Affects the Temperature of the Blood.—Experiments made by Drs. Ringer and Rickards on the affects of alcohol on man and animals, go to show that the temperature of the body falls nearly as fast after the use of alcohol in doses sufficient to produce intoxication, as after death itself. The facility with which drunkards freeze to death, is explained by this fact. Dr. Jolly declares, that an increasing tendency toward mental disease has been generated by the increasing consumption of spirits. Official reports show, that the abuse of alcohol accounts for one-fifth of the insanity in France.

Timber Planting is going on largely in Iowa, and a similar movement begins to be apparent in the prairie States generally. The woods preferred are ash, maple, walnut, chestnut and some evergreens. We must come to this in California. It pays well.

HAYWARD & COLEMAN,

IMPORTERS AND REFINERS

—OF—

Illuminating, Lubricating,

—AND—

PAINT OILS,

CONSISTING OF

KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS, NEATSFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

—ALSO—

Spirits of Turpentine and Alcohol.

Note.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

Lamps and Lamp Stock!

☞ A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.
☞ an elegant and complete assortment on hand.☜
5v17 tf. 414 Front street, San Francisco.

BUERK'S

Watchman's Time Detector.

This Watch-Clock was introduced to the public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

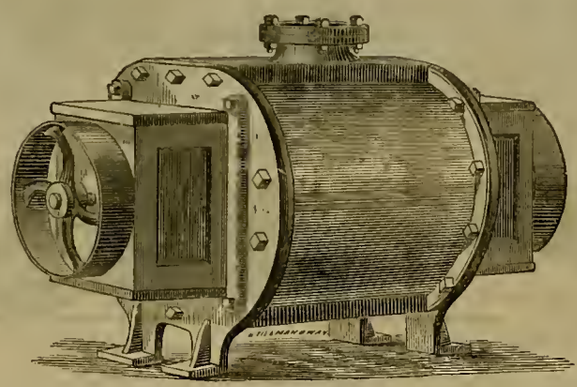
The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

This Watch-Clock is sold at a less price than any other in the market.

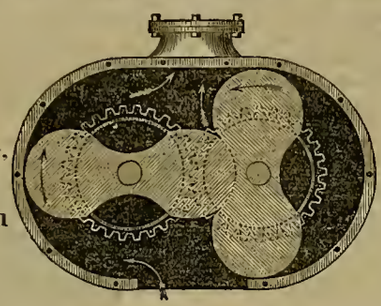
The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.



N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress street, Boston.
P. O. Box, No. 1057. 12v16-6m



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

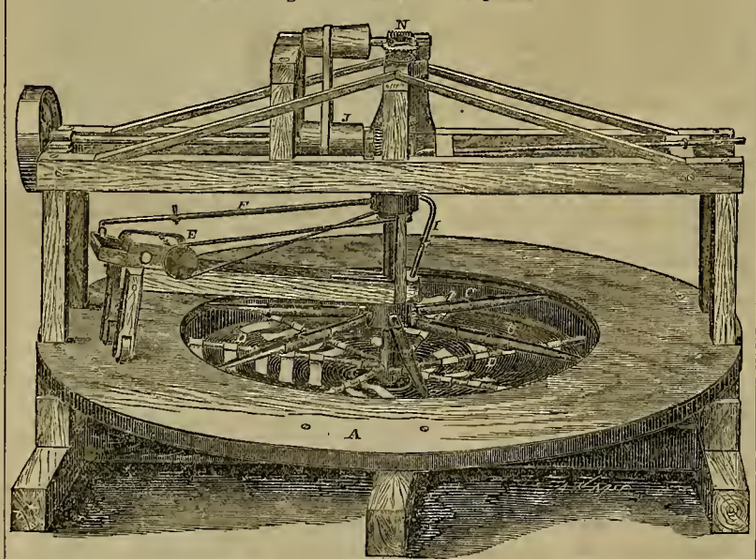
Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.



For Circulars and further information, address

KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'

IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to Thomas N. Paine, Grass Valley, California.

JOHN PERRY,

MANUFACTURER OF

Coccanut Matting, Rugs, Mats, Etc,

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

By a process entirely new, the proprietor is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purposes:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16 6m

Electrotype Cuts, Engravings, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

Subscribe for the New Volume of the Mining and Scientific Press.

The proprietors of this journal will undertako to make the Seveateenth Volume of the MINING AND SCIENTIFIC PRESS (commencing July 1st 1868), superior in many respects to former issues.

It will be printed on extra quality of paper, rendering it a handsome volume to file for future use.

An increased amount of editorial labor will be expended in the preparation of lesdiag articles relating to the progress of scientific developments in various parts of the world; new discoveries in geology, mineralogy, metallurgy, and new processes and methods relating to mining in all its branches.

Illustrations will be given of apparatus for saving precious metals, aad of machinery and inventions of general interest.

Each number will treat carefully on subjects of home trades, manufactures and domestic economy

Our mining summary and weekly stock report gives the latest news from the most important mines and miaing districts throughout the Pacific States and Territories.

An official list of patent claims issued to inventors on the Pacific Coast, is published in advance of all other jouraals.

The latest prices of stocks are quoted; also the produce and market rates, metal market and prices of copper ores.

Our "Mining Shareholders' Directory" advises holders of meetiags, assessments, dividends, sales, etc.

"Answers to Correspondents" afford much of interest to readers and of advantage to the community.

The Mechaaical and Scientific Miscellany contained on a single page of each issue we are frequently told is worth the price of the whole paper.

Iaformation contained in one article has been known to benefit a single subscriber an hundred fold the cost of a year's subscription.

The PRESS was established in 1860, and as a mining and mecbanical journal has met with unrivalled success.

Sample copies sent free on application.

Subscription, $5 per annum.

DEWEY & CO.,
Publishers, Patent Agents and Job Printers, corner Sansome and Clay streets, San Francisco.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

BROOKS & CAPP,
11v1 San Francisco.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books.—*Nevada Gazette.*

HENDY'S
LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in operation at the Union Iron Works, corner of Mission and First streets. This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Over 200 machines in successful operation in this State.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

FIRST—In setting up, set the pan, A, level by the inner rim, near its center.

SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]

THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.

FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (8 Concentrators).....Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....Nevada County.

EL TASTE CO. (2 Concentrators).....Sonora, Mexico.
B. F. BROWN (1 Concentrator).....Melbourne, Australia.
JAMES HENTY & CO. (1 Concentrator).....Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, ESQ.—*Dear Sir:*—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1868.

J. HENDY, ESQ—*Dear Sir:*— In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets.

Respectfully, etc. W. H. RODDA, Supt.

An Additional call for Hendy's Concentrators

Has just been complied with, and the machines shipped to Grass Valley, Nevada Co., Cal., viz: One machine for the Empire Company, and two for the North Star. Hendy's Concentrators have been in constant use in these mills for more than eight months, and these orders completed a set of ten machines for each mill. The North Star Company have just added eight new stamps to their machinery.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented April 17th, 1866, and May, 15th, 1868."

Mining & Scientific Press

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1855, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

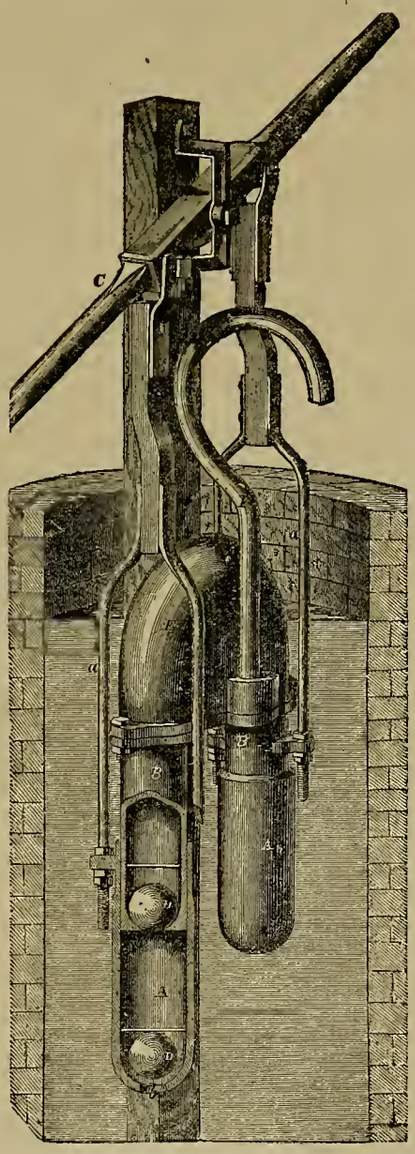
MINING AND SCIENTIFIC PRESS.

Subscription, $5 Per Annum. Single Copies, 15 Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, AUGUST 15, 1868. VOLUME XVII. Number 7.

REMOVAL.—The office of the MINING AND SCIENTIFIC PRESS, with the Patent Agency and Job Printing Office, connected therewith, will be removed, to-day, from its present location, 505 Clay street, to 414, on the opposite side of the same street, and about half a block lower down—just below Sansome. The object of this removal is to secure larger and more commodious rooms, and a building in which our business can all be placed together. The necessity which has heretofore existed of carrying on our patent business more than a block away from our main business office, has been a source of great inconvenience and annoyance, not only to ourselves, but to our customers as well. Our friends will hereafter find us as above.



Coal on the Pacific Railroad.

There is coal in great abundance, at not inconvenient distances, all along the Pacific Railroad from Chicago to Salt Lake; from which place on, there has been nothing discovered, but some thin seams of lignite on the Truckee. At San Pete, 120 miles south of Salt Lake, there is bituminous coal, which is claimed to be better than any west of the Rocky Mountains. At Pahranagat, 300 miles southwest of Salt Lake, there is good coal, and it is believed that coal exists throughout the entire territory of Utah, in large quantities. On the line of the railroad, the principal coal mining district will probably be about 80 miles east of Salt Lake. Thence eastward, it is found cropping out in the cañons everywhere, in masses sometimes fifteen feet in thickness; and it is a matter so common as to attract but little attention. People do not even take the trouble to locate eligible exposures. At Green River, an important halting place on the way, they have found anthracite, which is heavy and will not burn without a flame, but when used in a blacksmith's forge it gives an intense heat. The article has been tried, and found to answer for all purposes required. There is no danger of the beds ever being exhausted, so that Green River will be another important source of coal, where something in the way of civilization must necessarily soon plant itself. At Cheyenne, coal mining excited a good deal of attention last fall. The mining district around Central City, Colorado, will probably be supplied from Golden City—lying at the entrance to the mountains, between the former place and Denver—which has the appearance already of a bustling little manufacturing town. Going eastward on the Pacific Railroad, the next important coal mining district is in Iowa, a little distance beyond the Missouri River. It is not improbable that the Government will some day institute an exploration of the coal fields of Colorado, Dakotah, Utah, Nevada and California.

MAKING MONEY.—People do not seem to be generally aware that it is those persons who save money that make it in the long run. The best thing therefore that can be said to a young man is to remind him of some reliable savings and loan institution. Such is the French Mutual Provident Savings and Loan Society, whose office is located at No. 533 Commercial street.

Gerrish Submerged, Double-Acting Force Pump.

We give herewith an illustration of a pump which is acknowledged by all mechanics and engineers, to be constructed on truly scientific principles. It commends itself for its extreme simplicity. There is

GERRISH'S SUBMERGED DOUBLE-ACTING FORCE PUMP.

nothing at all complicated about its construction, or anything which is at all likely to get out of order. This machine was patented by J. A. Morrill, October 29th, 1867.

It is made of iron. The valves, as shown in the engraving, are solid rubber balls, which, when used in the manner herein described, are as nearly indestructible as any thing well can be. The pump may also be used as a fire engine, it being so constructed that a hose can be readily attached. This feature is especially valuable in country and mountain towns which are not supplied with the usual fire apparatus. It must work well at any depth, and a child can operate it. Being submerged it cannot freeze, It has no suction-valve or packing to get out of order. The water, as will be seen in the engraving, is raised by two outside sliding cylinders, one balancing the other, and requiring no force beyond the mere lifting of the water.

In examining the illustration, A A represent the two outside cylinders of cast iron. These cylinders have each a valve fitting closely into a turned valve seat. These valves consist of solid rubber balls, which are kept from rising too high by the small rod shown in the engraving. D D represents the valves. The cylinders A A are moved upward and downward over the stationary inside cylinders B B, by means of the connecting rod a, attached to the brake C. The inside cylinders B B are firmly bolted on to the air chamber E, which is also of iron. The discharge pipe F, connects with the air chamber at the bottom as shown in the cut. This pump may be seen and examined at the Pavilion. It is manufactured and sold by Linforth, Kellogg & Rail, Nos. 3 and 5 Front street, near Market.

CHINESE FARMING.—A writer calls attention to a fact which illustrates the industry and ingenuity of the Chinese. All along the coast the steep shores and even mountain sides, are made tillable by a system of terraces. The front or slope of these terraces is about six feet in hight, and protected by sod. The level space thus obtained is devoted to raising vegetables and general products of the soil. Only one kind of seed or grain, however, is planted on the same space, and no two spaces produce the same vegetable or cereal. Thus the traveler has presented a mountain side fringed with diversified vegetation. Rows of peas, beans, turnips, carrots, vines, etc., rise in regular series until the summit is attained. The flat or bottom land immediately on the coast is invariably devoted to rice. Their system of irrigation is complete, and all the lands devoted to this crop can be easily overflowed.

COAL MINING AT BELLINGHAM BAY.—Since the extinguishment of the fires in June, 1867, mining is again going on successfully, in the production of from 100 to 400 tons of coal a day, which is put on shipboard at the rate of about $3 a ton, cost. The company owns 3,000 acres of land, and they have expended in improvements $100,000. The Superintendent is R. E. Myers.

GOVERNMENT AID FOR THE SUTRO TUNNEL. In a letter to the Committee on Mines and Mining concerning the bill introduced in Congress to aid in the construction of the Sutro tunnel at Virginia City, the Secretary of the Treasury, Mr. Cullough, says he has no doubt if the proposed tunnel should successfully prove the indefinite downward extent of our mineral lodes it would greatly increase the value of our mineral land, stimulate mining, and result in vast benefit to the country. The Commissioner of the General Land Office, Mr. Wilson, says geologists appear to agree in the opinion that the Comstock lode is a true fissure vein, and that it will continue of equal richness to any depth which is practicable to work in the mines. In view, therefore, of what other governments have done for mines not having a tithe of its productiveness, and of the fact that as a nation we are at this moment deeply interested in the development of all our resources, and pre-eminently so as to those of the precious metals, the Secretary acknowledges the belief that if the policy of a loan of the public credit, as adopted by Congress in regard to the continental railway, should be extended to the enterprise, now under consideration, the results that would follow would be of great value to this Republic.

PREMIUMS OFFERED.—The Committee on Premiums offer *forty-six* silver medals as special premiums, to be apportioned among the several classes according to their value or importance; and *sixteen* gold medals for the most valuable display of California products and manufactures, one each for classes Nos. 1, 2, 3, 4, 8, 9, 10, 13, 14, 15, 16, 18, 22, 53 and 27, as already given in the columns of the FAIR PRESS. A grand jeweled medal, valued at $200, is to be awarded for such meritorious invention or industrial product as, in the opinion of the judges, will be of the greatest benefit to the people of California amongst all the other fine things exhibited.

MANUFACTURE OF STEEL DIRECT FROM THE ORE.—The enormous progress which has been made within the past few years in connection with the iron and steel manufacture is sufficient to justify the hope that the oft-attempted process of obtaining steel direct from the ore, will at last be brought to a successful termination, more especially as it is now stated that furnaces have, within the last few months, been erected at Birmingham, by which pure steel can be produced at once direct from the ore, without the expenses, uncertainty, and other disadvantages attending the old and tedious processes.

GLASS WORKS.—Having seen the display of carboys, demijohns, and variously shaped respectable old bottles, labeled "syrup," "I. X. L.," "Stomach Bitters," etc., exhibited by Bennett & Co., of the Potrero Glass Factory—for which John Taylor & Co., No. 514 Washington street, are the agents—visitors to the Fair, and especially those who have occasion to use or deal in glass, cannot do better than to take a ride across the Long Bridge, and have a look at the wonders of that incomparable art, which was discovered by the Phœnician sailors two thousand years ago, and yet which the majority of us know so little about.

Mechanics' Fair.

[From the Mechanics' Fair Daily Press.]

Opening of the Fair.

This event took place at "high noon" on Saturday, under satisfactory auspices, and much to the pleasure of all who participated in the proceedings. A temporary cessation was effected as to hammering and sawing—in spite of the itching of many arms that were restrained—and the programme was carried out in full. First, the President of the Institute, Mr. Hallidie, in company with the orator of the day, the Hon. Newton Booth, of Sacramento, and the chaplain, the Rev. Horatio Stebbins, mounted the platform, being immediately followed by the substantial men, the workers and elders of the Mechanics' Institute. Chants and hymns beautifully appropriate to the occasion, were sung by 200 boys, led by the trumpets and saxe horns of Willis' band, with grand effect—a treat to listen to. The oration will speak for itself in the columns of the PRESS. Mr. Booth is a representative of the mercantile interests, and an excellent example of that broad minded trait which views and generalizes from the penchant facts surrounding us, and the existence of which in a class is the sure index of the greatness of a community. His remarks will bear reading all the way through.

The labors and cares of opening and arranging such an exhibition are incredible. We deem it, therefore, but slight acknowledgement to recognize, in behalf of the public,—for whose benefit all this work is inaugurated,—the untiring energy and obliging self-sacrafice of the working committees, and especially of the President, Mr. Hallidie, whom everybody meets and has to talk to that has anything to do with the Fair. We append hereto the

HON. NEWTON BOOTH'S ADDRESS.

Whatever virtues may rightly be ascribed to this 19th century in which we live, humility is not one of them. It is a philanthropic age. Never before were there so many benevolent organizations, never were the helpless, the blind, the insane, so tenderly cared for. It is a heroic century—its sixty-eight years have been full of that heroism that does not "set life at a pin's fee." It is a democratic age. Never have the people been of so much account, and seldom has genius been so rare. It is preëminently an age of mechanical invention. It makes steam bear its burdens, lightning carry its messages, the sun paint its pictures. But it is not a modest age. It does not lack of self-confidence or self-praise. It is brimfull and running over with egotism. It regards with self-complacent pity the centuries gone before that did not have steamboats, railroads and telegraphs, sewing machines, cooking stoves, lucifer matches, steel pens, cylinder presses, power looms, cotton gins, gang plows, reapers, threshers, apple parers, turning lathes, nitro-glycerine, giant powder, columbiads, needle guns, Colt's revolvers, steam paddles, track layers, baby jumpers, chloroform, photographs and coal oil. It looks with a kind of commiseration on the ages to come, when the world will have to use old tools, as ingenuity and human nature will be alike exhausted, and there will be no new forms to invent, no new forces to discover. If it experiences a momentary chagrin because it has not achieved the perpetual motion, nor successfully an Aviator, it is consoled with the reflection that it has not accomplished the first because it is impossible, and that it will the second because it is possible. In short, whoever has not managed to be born in the 19th century has been very unfortunate, or has made a great mistake.

Standing in this temple of art, this armory of labor filled with the implements with which toil carries on its warfare with want, and beautiful with the evidence of its triumphs, we may at least claim, with becoming modesty, that the world is now fast learning how it can most easily get its daily bread—how labor can be made most productive, for the supply of physical wants. Two other questions behind that—how the burdens and rewards of labor shall be equitably distributed, and how the time not needed for the supply of physical wants shall be so employed that the age may be clothed with an intellectual and spiritual glory equal to its material wealth and power, it has scarcely begun to solve—questions that may not be rightly solved until a civilization shall arise as superior to ours as ours is to barbarism, in a future as distant from us as we are from the creation of man.

The problem of daily bread, however, is neither easy nor unimportant. If men depended upon nature alone for food, upon game, fish and wild fruits, the country would be crowded where population averaged one to five square miles. The trapper was right, if he would remain a trapper in moving further west because the settlement was getting too thick for elbow-room when his neighbor built his cabin only ten miles away.

Consider what the world consumes every year. 200,000,000 pounds of flour, and 13,000,000 pounds of meat go down the throat of New York city yearly. Multiply by 1,000,000, and if you can conceive the result, you will have some idea of what it takes to feed the world with bare necessities. California consumes annually 365,000 barrels of flour, 700,000 bushels of potatoes, 70,000 000 pounds of meat, 1,000 tons of codfish, 38,000,000 pounds of sugar, 5,000,000 pounds of coffee, 1,500,000 pounds of tea, 5,000,000 pounds of butter, 20,090,000 pounds of rice; wears out $15,000,000 worth of dry goods and shoe leather, and burns up, besides houses and mountain towns, 250,000 tons of coal, 4,000,000 pounds of powder, 4,000,000 of candles, 1,000,000 gallons of coal oil, and 50 000,000 of cigars; not to mention the 1,500,000 gallons of whisky that annually assist to consume us. If all this had to be raised, mined and manufactured, or paid for by the labor of our hands, unassisted by art, we would have few holidays, and no pageants like this. If the world had to be housed, fed and clothed with only such crude tools as actual necessity would suggest, the many would be slaves to the few, and worn out in their service, or all would be the slaves of toil. There could be no accumulations, nothing laid up against a bad season or a rainy day, and the wolf would be continually at the door. Then whoever would succeed in pointing a stick with iron to scratch the ground, at seed-time, and whoever would teach a dog to guard the sheep while the shepherd slept, would be benefactors of the race. The man who would discover that salt would preserve meat, would deserve a patent of nobility; he who would raise a horse and make him draw a sled and carry his master, would be a king; and he who would make the wind and the water turn a wheel to grind the corn, might be worshipped as a god. Then imagine that after a day's toil that brought up no hope, and a night's sleep that brought no dreams of rest, men should suddenly awake as into a world of enchantment, and find themselves supernaturally endowed, so that they could accomplish with their hands, or by a wish, all the tools, machinery and appliances of modern life, as though each had a hundred arms and were gifted with magic—as though each were winged with swiftness like the wind, had sinews of steel and strength like the power of steam, and you will appreciate the miracle of art—realize what a load of toil invention has lifted from our shoulders, what a burden of care it has taken from the heart of humanity. Then, too, you will learn where the leisure comes from after actual wants are supplied, part of which goes into luxuries, ornaments, books, newspapers, paintings, music, houses, schools, churches, cities, culture, part into idleness, ennui, whisky, tobacco, fast life, folly, vice, crime, and all of which is called—civilization.

But this miracle of art is not the work of a night or the glory of an age; it is the work and glory of the whole of man's life on earth. In fable, Minerva sprang armed and panoplied from the brain of Jove; but in fact, art is the slowest growth of time. Take as an illustration the art of printing. The idea of printing is older than history or tradition. It is so natural and easy, it would have been strange if the idea of the printed book had not been suggested to Adam, if he had known his letters, by his own footprints on the sand. Seals were in use before the book of Job—possibly the oldest book in the world—was written; and seals used for making impressions contain the whole principle of printing. Bricks and tiles covered with characters, impressed upon the clay before it was burned, were common not only in Rome and Athens, but in Babylon and Nineveh. Wood engraving was brought into Europe from the East, long before books were printed. The printing of playing-cards probably first suggested the printing of books, which was at first simply wood engraving, each page being printed upon a block with raised letters. Then the letters were separated into wooden movable types; then metallic types were cast. Meantime the Arabs, by what processes of thought, by what slow stages of invention, I know not, had progressed from using the bark of plants, the papyrus of the Egyptian, to the manufacture of paper. The method of casting types, so that they could be easily multiplied, and the manufacture of paper, were the real difficulties in the invention of printing; when these were overcome, the Hoe cylinder press became easy, though it took the improvements of four hundred years to attain it. Nay, the press snowing newspapers daily all over the land, and sending streams of knowledge through all lands, so that whoever is athirst may come and and drink, was as inevitable as the succession of the ages when Job had written: "It is turned as clay to the seal."

Two centuries before the Christian era, Hero of Alexandria described a steam toy, a mere plaything. After two thousand years experiments, suggestions and improvements, the plaything became the steam engine. In the same manner the round-bottomed canoe, made from a log hollowed out with fire, grew into a ship. Fulton combined these two growths and made the steamboat. For more than one hundred years before Watt was born, the tramroad had been in use in England for conveying coal from the colliery to the place of shipment. Parallel rails, at first of wood, then of iron, were laid, to which wagons with grooved wheels were fitted and drawn by horses. Stephenson took the steam engine of Watt, added the steam blast, mounted it on driving wheels, and made the locomotive; put it on the tramroad, and gave the world the railway.

Hargrave's spinning-jenny, Arkright's spinning-frame and Cartright's power-loom, which were but the development of the distaff, the spinning wheel, and of the hand loom, in which Joseph's many-colored coat was woven, were contemporary with the invention of the condensing steam-engine by Watt—about 1780—and the method of puddling and rolling iron immediately followed. The steam-engine revolutionized industry—as gunpowder had war — furnishing a power stupendous in its strength, marvellous in "the ease, precision, and ductility with which it can be varied and applied, so that it can engrave a seal, or crush masses of obdurate metal; draw out without breaking a thread fine as a gossamer, and lift a ship of war like a bauble in the air; embroider muslin, and forge anchors; cut steel into ribands, and impel loaded vessels against the fury of the winds and waves;" it not only supplemented all mechanical arts, but it so stimulated the inventive faculties, that since then men have expressed their best thoughts in wood and iron. Surrounded here by these thoughts embodied in the visible forms of industry and art, we are in the presence of a poem, the epic of progress, in which the voices of all the ages blend, grander in its suggestions, more inspiring in its hopes, and sublimer in its theme, than Homer, or Dante, or Milton sang.

But let us not suppose that the germs of art have reached their full fruition in our age, nor that the future will plagiarize the present or repeat the past. A galvanic toy, the plaything of to-day, may one day supersede the steam engine. Steam, that is usually cited as the highest instance of the dominion of mind over matter, is expensive in the machinery and fuel it requires, dangerous and destructive in its explosive properties. Nature's grand forces are silent and safe. The rays of the sun exercise on earthly objects every day a *mechanical* power "in comparison with which the erection of the Egyptian pyramids dwindles into the labor of mites." The force that binds the earth together, particle to particle, is mightier than the earthquake that comes in visitation of terror. Who can touch the chain by which the sun holds the planets in their orbits? Hear what Prof. Tyndale, the highest scientific authority, says, after a mathematical calculation of one of the molecular forces that are lavished around us. "I have seen the wild stone avalanches of the Alps, which smoke and thunder down the declivities with a vehemence almost sufficient to stun the observer. I have also seen snowflakes descending so quietly as not to hurt the fragile spangles of which they are composed; yet to produce from aqueous vapor a quantity of that tender material which a child could carry, demands an exertion of energy competent to gather up the shattered blocks of the largest stone avalanche I have ever seen, and pitch them to twice the hight from which they fell." Shall not these forces in which nature is so prodigal be utilized in the art and service of man?

There are dominions of thought in which the mind has reached the limits of its capacity, but not in the sphere of mechanical invention. If we could be permitted to enter an art exhibition at Athens in the days of Pericles, while wandering through the department of machinery, agricultural implements, mechanical tools and power, we might exclaim against the poverty of the Greek mind, and the barrenness of Grecian life. But when the statues of Phidias were unveiled—when those marbles "whose headless, armless trunks, in their severe and awful beauty, are at once the delight, admiration and despair of modern artists," stood revealed in the full glory of their original perfection, we would admit that there, at least, the world had made no progress, for none was possible.

Or, if a pupil of the divine Plato could revisit the earth, he might hear at the High School in San Francisco, boys and girls reciting like a hackneyed tale, truths in science his master would have died to know; but when he would mingle with the sages of the earth, he would find that in philosophy the thoughts of his great teacher were the boundaries of human speculation, that the highest office of philosophy now was but to interpret thoughts uttered two thousand five hundred years ago. He could wander around the earth and hear no language spoken superior to the Greek in purse compass and flexibility; and he would learn that in poverty, eloquence and history, Grecian mind had furnished the models for all succeeding ages, in eloquence, poetry and philosophy, in sculpture painting, and possibly in the forms of architecture, in language as a medium for the expression of thought, and possibly in music, the language of the emotions, there will be no higher attainment than has already been reached. No race will ever arise superior to the Greek in intellectual and physical organization: and no men born of women will ever thrust Homer and Shakspeare, Phidias and Raphael, Demosthenes and Mozart from their thrones of pre-eminence.

There are also two devices, or inventions, which are, humanly speaking, perfect. One is that of Arabic numerals and the method of decimation, by which the ten simple figures the school boy scrawls upon his slate can be made to express everything the mind can conceive in numbers, reaching upward toward the infinite, and downward toward the infinitesimal. The other is the invention of the alphabet, of letters, by which 26 characters have become the factors of all human intelligence, bearing from generation to generation the thoughts and wisdom and learning of men; have become the world's memory, permitting nothing to perish that is worthy to survive; an invention so difficult to conceive, so simple in use, so grand and complete, that the world had better lose all other arts combined than to forget its A B Cs. Sometimes I have thought of them as of 26 soldiers that set out to conquer the world. That A was an archer, and B was a hagler, and C was a corporal, and D was a drummer, and E was an ensign, and F was a fifer, and G was a gunner, down to Z was a zouave, and these 26 drill-sergeants have subdued the kingdoms of the earth and of the air, taken possession of the realms of thought and founded a republic of which the wise and noble of all time are citizens and contemporaries, where there is neither death nor forgetfulness—the imperial republic of letters. Again I have thought of them as of a telegraphic cable laid beneath the waters of time, safe from disturbing storm and tempest—so short, the child's primer will contain it, so long it connects the remotest ages with the present and will stretch to the last syllable of recorded time. We pride ourselves on the successful laying of the Atlantic cable as the crowning achievment of human invention; but here is a cable that speaks not in broken, doubtful, and syllable utterance, but charged with the whole spiritual power of all human intelligence, with a circuit reaching through all time, connecting all brains and all hearts in its net work, and certain to carry every message worthy to go there to the last man who shall live upon earth.

Here is an invention so simple that the child learns its use while playing with his blocks; so grand that all generations cannot exhaust its capabilities; so perfect, no age will be able to add to or take from. In the invention of letters, man arose nearest to creative power. In other inventions he has dealt with material substance, with tangible things; in letters he created from nothing forms into which he himself could breathe the spirit of life, the immortal soul of power and eloquence and beauty.

In letters, the mind has reached the highest heaven of invention; in literature and the fine arts it has touched the boundaries of its power, and knows where the horizon meets the ear h; but in science and the mechanical arts there will be no limit to improvement while nature has one secret unrevealed, one force unappropriated. In those grand domains there "is ample scope and verge enough" for the thought, investigation and skill of all generations to come, and the work of each generation will be but the scaffolding on which the next shall stand, building toward a sky that recedes as it is approached.

With grateful reverence to the past, whose inheritance we enjoy, proud of the achievments of the present, looking hopefully to the future, to whose glories our exertions will contribute, in the name of free and intelligent labor, we dedicate this Hall to Industrial Art, conscious that year by year succeeding structures will here arise, dedicated to the same purpose, in ever-increasing magnificence of display and completeness of design and execution, evidencing progress of our State, our country and the whole race of man.

Our General Review.

STEAM ENGINES, Etc.

CLASS I.

The various articles on exhibition at the Pavilion, have been arranged into 30 classes, according to a list which has already been given in our columns. In our reports, we propose to take up those classes, as near as may be in their order, and shall continue them, from day to day, until the entire list is completed.

The Managers of the Fair have very properly put the steam engine—the most important of prime movers—the first in the official classification of articles to be exhibited at the Exposition. This important machine is also more perfectly exemplified in this Exhibition, than is often the case, even in much more pretentious mechanical displays than the one now in progress in this city. We have here three first class engines, quite dissimilar in make, and exhibited by as many different makers. We have also several smaller ones, down to those of mere model size, including among the latter, one constructed of glass, where the entire process of generating steam, conveying it to the motor, obtaining from it all its available power, and finally rejecting it into the atmosphere, where it is quietly and perfectly absorbed, may all be readily seen and observed.

The history of the steam engine from its first conception and from the early and rude contrivances by which the employment of steam was first made of practical utility, down through all the infinite variety of forms the engine has assumed in the course of its application to the infinite variety of purposes to which it has been applied, forms the most interesting and important chapter in the narrative of the world's progress in industry and art.

All the forces of nature, which it is the business of the engineer to adapt to the uses of man, are directly referable to the effects of heat. The streams which turn our water mill wheels are first elevated to the clouds by the heat of the sun; the breeze which turns the arms of our windmills is generated by local expansions of the atmosphere, due to the same source of heat; the gas or air engine can only be operated by heat. The steam engine is the recipient of the power of the heat thrown off by the combustion of coal, conveyed to it by the elasticity of vaporized water. What the generation of the vapor costs, and what it does depends mainly upon the construction and arrangement of the boilers where it is generated. Different kinds of fuel require differently constructed furnaces. A full and perfect combustion of the fuel, even to the smoke and volatile gases is essential to an economical employment of steam power. There has been nearly or quite as much study expended to secure the proper construction of furnaces and boilers, as has been devoted to modifying and improving the construction of the engine.

Go with us to the little unpretentious shed outside of the main exhibition room, and just by the Post street entrance. Here you will see the source of that quiet, yet giant power, which puts in motion all the thousand wheels, large and small, which go to make up the enumeration of the machinery which is already, or soon will be in operation throughout that department of the Exhibition. A few shovelfuls of fine coal, which the housekeeper would reject as worthless, aided by an armful or two of carpenters' chips, is, as it were, by magic, converted from inert rubbish into a power or force which will grind our corn, saw our wood, spin and weave our cloth, plane, forge and polish our iron, sew up our garments, and in fact do almost everything which man can perform, except to think and talk. All this is accomplished by steam, which takes up the heat produced by combustion, carries it along through arterial pipes to the steam engines which act as motors, moving with steady force the iron arms and fingers which

man has devised to go through their marvelous motions, in the accomplishment of work which, for precision and exactness, cannot be equaled by the most skillful of human hands!

STEAM BOILERS ON EXHIBITION.

There are but three steam boilers on exhibition, two of which are employed to make steam for driving the machinery, both built at the Miners' Foundry. These boilers are tubular in construction, 16 feet long, 48 inches in diameter, and contain 50 3¼ inch tubes each. They are both fitted up with Harris' Steam Superheater, of which we shall speak at length in a future number. These boilers are of very superior workmanship, and are capable of making steam for about 80-horse-power.

The only other boiler exhibited has been temporarily placed near the Post street entrance; it bears the entry mark, No. 109, C, and is a representative boiler of a class which should become the type of the great majority of boilers in use. This is the only steel boiler ever exhibited on this coast, and the third which has been made here. Its two predecessors were made some ten years ago for the Almaden Quicksilver mine, where they are still at work, and apparently as "good as new." This boiler has been made from Frith's best steel, which has been imported to this State especially for this class of work. It is a tubular boiler, sixteen feet long by forty-two inches in diameter, and contains thirty-eight tubes. It is [one of the finest specimens of boiler-making which we ever met with. This piece of mechanism is from the Risdon Iron and Locomotive Works, corner of Beale and Howard streets, a recently formed association, of which Joseph Moore, is Superintendent.

EXHIBITORS OF STEAM ENGINES.

There are three large steam engines on exhibition, one each, from the Pacific, the Union and the Miners' foundries. Each of these engines is representative in character, and presents points of novelty and interest which will be fully discussed in a subsequent issue of the PRESS.

There are three miniature engines in the Exhibition, which may be classed among the novelties of the Fair. First, we have one with a cylinder of three-inch bore and six-inch stroke, built and designed by Master S. G. Higgins,—a two years apprentice at the Union Foundry. This engine has been built by Master Higgins, out of regular working hours, the labor being mostly done at his home, where he has fitted up a foot-lathe with which to employ such of his leisure hours as are not devoted to books. The engine is employed to run several pumps, taking its steam from the main boiler. It is a very superior specimen of workmanship for an apprentice.

As a companion to this piece of machinery, we have another of the same sort made by Robert Blair, during the first year of his apprenticeship at the Vulcan Iron Works. It is of about the same size with the one already described, and is employed in running one of Hendy's Concentrators. An inspection of these pieces of juvenile workmanship, calls forth constant remarks of admiration from visitors, and are gazed upon admiringly and with wonder by throngs of juveniles, who very properly appear to consider them as their peculiar part of the Exhibition. They may be considered as a part of the legitimate fruit of exhibitions of this character, and may the youth who look upon them find much food for meditation, and go away with firm resolves to imitate and emulate.

Another novelty in this line is a beautiful miniature steamboat engine, made by Mr. C. H. Foster. This engine has a cylinder of 1½ inch bore by 3-inch stroke. It has a boiler attached and makes its own steam by means of several alcohol burners, which take the place of a furnace.

Still another novelty in the miniature steam engine line is a "Glass Engine," which appears to have been set up as a "side show," in connection with glass blowing and other mysteries, which we have not yet penetrated.

WRIGHT'S VARIABLE CUT-OFF STEAM ENGINE.

This fine, smooth-running steam engine, is exhibited by the Pacific Iron Works, located immediately inside of the Post street entrance to the Pavilion. The engine in principle and construction is quite novel, has been designed and built at the foundry aforesaid, and is a California engine. In simplicity of construction and beauty of design, it would be a credit to any establishment. It possesses strength to an eminent degree; while its mechanical arrangement is simple and convenient. Visitors are especially impressed with the smoothness with which it works—no jar, vibration or noise accompanying its action.

Its motion, which is exceedingly uniform, is made so by the admirable self-adjusting steam cut-off, which is the only thing about it not altogether Californian, and to which we propose to call the attention of the reader for a few minutes.

By a careful inspection of the engine, it will be seen that the spindle of the governor passes through a cam just above the bevel gear by which it is driven. This cam, being firmly attached to the spindle, by its revolution works a cut-off, as is distinctly shown. By the peculiar construction of this cam and its connection with the spindle and balls of the governor, an automatic action is produced by the governor as the rotation of the balls is more or less rapid. This automatic increase and decrease of the eccentricity of the cams regulates the amount of steam admitted to the cylinder.

To produce this effect the cam is made in two pieces, one consisting of a hollow shell or cylinder, with a part of one end formed into a cam proper. Throughout the entire length of this piece, upon the inside, there is a spiral groove cut to receive one end of a piston by which its eccentricity is regulated. The inside piece is a hub, which exactly fits in the hollow of the cylinder, and has a socket into which the spindle of the governor is screwed, the other end forming a bearing with a bevel wheel on its extremity, to convey motion from the crank-shaft gearing to the governor and cut-off. There is a hole through the length of this inside piece, which is continued through the spindle of the governor, and which contains the rod that connects the cam with the governor. This hole is eccentric to the outside surface of both the hub and its enclosing cylinder, but is concentric with the governor rod. Both the hollow cylinder and hub are connected by a feather, one piece of which is of a spiral form, and the other straight or rectangular, the two being connected together by a slab on the rectangular piece, which fits into a hole or bearing in the spiral piece, so that the latter can turn on the slab and accommodate itself to the groove in which it has to work. The spiral part of the feather works in a straight groove in the inside of the hub, the inside of the rectangular piece being fastened to the governor rod, so that the feather is permanently connected with the governor. Motion is communicated from the crank-shaft by rods and bevel wheels as shown in the engraving; the same being transferred to the spindle of the governor, as the balls rise or fall by reason of the variation of speed.

Any speed may be selected at which it is desired the engine should move, and any variation from that speed will be instantly felt and adjusted. We hope soon to give an illustration of this ingenious arrangement, by which it may be more fully understood; in the meantime, a careful observance of the apparatus in motion, in connection with the above description, will enable the mechanic, at any rate, to get a very good idea of the principle.

Weissenhorn's *American Engineering*, the highest scientific and mechanical authority, speaks of this engine as follows:

"The simplicity of this 'cut-off,' the facility with which it can be can be adjusted—the parts being but few and always in sight and accessible—its action so quick and perfect, and no throttling of the steam, but permitting it to enter the cylinder at boiler pressure—all combine to make it a most perfect cut-off."

Mechanical.

CIRCULAR VESSELS OF WAR.—The London *Artisan* of July 1st, gives a series of illustrations of various forms of circular vessels, as designed by Mr. John Elder, of Glasgow. It is claimed that the idea was first suggested by Napoleon the First, when scheming for his celebrated project of the invasion of England. Mr. Elder, however, is the first who has taken a practical view of the subject, which is now attracting considerable interest among naval engineers in Great Britain. These circular vessels are a class of iron-clads—nothing more or less than floating forts, designed to act entirely on the defensive, and to revolve when in action. Various modifications in the construction of such vessels are given in the course of the illustrations alluded to. The *Artisan* thinks Mr. Elder's designs are worthy of careful consideration, adding that "though at first sight the idea appeared somewhat chimerical to us, the more the designs are looked into, the more possible they appear." The London *Engineer* has also spoken very favorably of the project; and it is more than probable that a practical demonstration thereof will soon be made.

Want of Planer Fixtures.

The question is often asked why it is that in the majority of jobbing machine-shops the planer stands so much neglected, and its services are so seldom brought into requisition, when it might be made useful and profitable in a multitude of operations that are performed by other and more costly means. The answer is that there is usually experienced a paucity of appliances to hold work, and a lack of readiness among mechanics to adapt fixtures when such appliances are wanting. We see how often the lathe is made to perform many operations that rightfully belong to the planer, and so readily can a few simple attachments be fitted to the lathe that it often subserves, in many establishments, the two-fold purpose of both tools. As an instance, we might mention the grooving of reamers and screw-taps. The lathe to do this is so arranged that the work is not permitted to revolve, by its not being connected with the face-plate, yet the lathe acts as in the operation of turning in every other respect, the tool being made to feed as usual, and when so progressing it removes a shaving from a rod or cylinder in a longitudinal direction as it thus travels or feeds along. This is often done while the planer stands neglected. The reason is self-evident. There is no fixture upon the planer to hold such work, while the lathe-centers present a ready means for so doing. It is needless to affirm that "centers" are an indispensable adjunct to the planer, yet are not always found in connection with it, and when such neglect is evident then there may be an excuse for fluting reamers, cutting key-seats, and performing similar operations upon the lathe. Unless work of this character can be done at the lathe with a mill or circular cutters, it ought not to be submitted to the action of tools similar to turning tools and in the manner described, as much injury to the tool carriage is often the result. The lathe is especially designed to produce circular cutting, and should be employed to produce no other; and let the planer be fitted with sufficient tools and fixtures to hold any kind of work, and its sole office be to accomplish all the straight cuts that are needed to be made.

GUANO AND CHEMISTRY.—Instead of being used for manure, guano has also been found an economical source for the manufacture of phosphoric acid, embracing the igniting property in friction matches. Thus the same material that raises the food of man and beast lights the fop's cigar. It builds up the hay rick and wheat stack, and helps to form the instrument with which the incendiary burns them down. Wealthy farmers and street Arabs who sell halfpenny boxes of lucifer matches are often dependent on the excretions of sea birds who frequent a desert rock in the West Indies.

RAILROAD SIGNALS.—In the course of the trial of an engine-driver at the Gloucester (England) Assizes, on a charge of manslaughter, of which he was acquitted, the counsel for the defense incidentally gave an easy rule for remembering and distinguishing railway signals:

White for "right," *red* for "wrong,"
And *green* for "gently go along."

Scientific Miscellany.

SCIENCE AND THE LOSS OF QUICKSILVER.—When quicksilver is used for the amalgamation of metals, the presence of chlorine will, under certain conditions, cause it to combine with the quicksilver, forming calomel, which has a different specific gravity from the amalgam, and is, therefore, carried away and lost. It is estimated that 300,000 tons of quicksilver have been lost in that way. G. H. Munn advises the treating of the insoluble residue with nitrate of soda and hydrochloric acid, in order to convert the insoluble subchloride of mercury into the soluble bichloride, or corrosive sublimate. This solution is to be treated with sulphide of calcium, which is formed as a winter product by the final reduction process. The mercury will be changed thereby into a black sulphide. After drying, the sulphide is to be placed in retorts, with the proper amount of slacked lime. The mercury is then obtained by distillation, and is caught in a receptacle containing water, connected with the retorts. The sulphide of calcium residue in the retort is then used for changing the sublimate into the black chloride. All this seems to be simple enough if it is capable of being economically carried out. The calomel could be separated by means of some one of a score of well known mechanical devices for such a purpose.

INTERESTING SCIENTIFIC FACT.—Mr. W. R. Birt has called the attention of astronomers to a spot now visible on the surface of the moon, and presenting the same phenomena as those latterly observed in the crater Linnæus, and the true nature of which might be investigated by means of photography. The spot in question is situated under two degrees west longitude and five degrees south latitude, and presents variations of appearance which can hardly be explained otherwise than by volcanic action, exactly as in the case of Linnæus. Now, in Mr. Birt's opinion, these apparent changes of shape can only be explained by supposing that these two craters are provided with a sort of lid, which, from time to time, conceals the orifices. Such a lid might be made by filling up, and crusting over the orifice by cooling.

ACTION OF WATER UPON LEAD.—The conditions which determine the action or non-action of water upon lead, have hitherto been involved in much obscurity. The Government Commission for the supply of water to the city of London, established the fact some years since, that the presence of "dissolved oxygen" (oxygen mechanically mixed with water), and the absence of more than three volumes of carbonic acid, in 100 volumes of water, are among the conditions necessary for its injurious action upon lead. It has more recently been discovered that water which acts powerfully upon lead can be completely neutralized in that respect, by momentary contact with animal charcoal or bone-black. Phosphate of lime, the chief constituent of animal charcoal, is also a complete preventive of the action of water upon lead.

ELECTRO-MAGNETIC MOTOR.—By an invention of L. C. Stuart, recently exhibited at the College of the city of New York, a series of magnets were longitudinally arranged in an open case, about three feet long, so that they could be connected at pleasure, by a wire, with a battery in the basement, which consisted of forty cups. When the current was turned on the magnets were so ingeniously placed in connection that they revolved rapidly like an axle. This magnetic axle turned a small wheel, and worked the piston-rod of a pump by which water was raised nine feet. It would be rated in the market at a quarter-horse power. The cost of working was fifteen cents an hour. Prof. Doremus said it was in advance of anything of the kind yet produced, and could be turned to practical account in various mechanical operations.

Mechanics' Fair.

[From the Mechanics' Fair Daily Press.]

General Review of the Exhibition.

STEAM ENGINES, Etc.

CLASS I.

[Continued from Page 99.]

In continuing our notices of the engines on exhibition, we come now to the one farthest removed from the Post street entrance. This engine has been manufactured by H. J. Booth & Co., and in its massive proportions and simplicity of design, makes a very fine appearance, and attracts a large share of attention from visitors. The rods connecting the different parts of the engine are few in number straight and direct, giving the desired effect without complication or friction.

It has a cylinder of 16-inch bore, with a 30-inch stroke, 8-foot hand wheel and 16-foot fly-wheel. The chief interest connected with this engine, consists of

SCOTT & ECKART'S AUTOMATIC GOVERNOR AND SLIDE VALVE CUT-OFF,

Patented June 25th, 1867, by Irving M. Scott and William R. Eckart, of this city. This invention forms a very beautiful and simple contrivance for controlling the speed of an engine under all conditions, whether loaded or suddenly relieved from the entire work or gradually unloaded. The principle consists in connecting the ingress of steam directly with the governor, making it supreme, shutting off or letting on steam as circumstances determine. This is accomplished by means of connecting the cut-off plates with two gears, which are moved by the governor either close together or far apart. The friction of the valves and machinery is held by a screw upon which the governor acts, thus relieving the governor from all work except the adjusting of the plates. By an ingenious contrivance this screw is made to unhook the clutch when the valves are wide open or when they are shut. This is an important point, for if the engine should ho run at a speed not sufficient to move the governor when the valves are wide open, the clutch is withdrawn and no work or wear is on the governor, and the engine has the benefit of steam for the full length of stroke. Again, if the speed should be suddenly accelerated and the valve shut, the clutch is disengaged at that end and the engine quickly controlled, while no work or wear is on the governor. So long as the speed is kept up the facility with which perfect regulation of speed is accomplished may he seen when fifteen revolutions of the governor move the valves from one extreme to the other, and the governor makes 65 revolutions per minute; thus, in a quarter of a minute, a movement takes place either to turn on her whole steam or to shut it off, and the engine cannot vary in speed under such conditions. It has the advantage of opening the steam port wide at every admission into the cylinder, a very important point which prevents wire-drawing of steam. Another point of great importance is this—supposea cut-off attached to the governor, such as the Corliss, Putnam, Green, or Reynolds, and the gearing or belt which drives the governor should break or run off, the governors immediatcly turn on full force of steam, and the engine is sent whirling at a fearful speed, without any regulator at all. But in the Scott & Eckhart, if the belt or gearing breaks or gets out of order, the steam is left gauged precisely as it was at the time of the breakage, which will give ample time to the engineer to discover the accident.

There are nineteen of these engines in use in this and adjacent States, all with good reeults, as a simple and effective machine, and located as follows: Crescent Mill, Plumas County; Rawhide Ranch Mill, Calaveras; Keystone Mill, Amador; Manhattan Mill, Reese River; Twin River Mill, Kern River; Vulture Mine, Arizona; French's Mill, Silver City; Angels Camp, Calaveras; Genesee Flour Mill, San Francisco; Sacramento Water Works; Hunter's Valley Mill, Mariposa; Quail Hill Mill, Calaveras; Kimball's Carriage Factory, San Francisco; Venus Flour Mill, Oakland; Rising Star Mine, and one now at the Mechanics' Institute Pavilion. These engines vary in size from 14-inch cylinder with 30-inch stroke, to a 20-inch cylinder with 42-inch stroke.

THE HICKS STEAM ENGINE.

Located between the two engines already noticed, is one of very peculiar construction, which attracts much attention for the novelty of its appearance and construction. It is one of the plainest and simplest pieces of machinery in the Pavilion, and will be used to-day as the motor for the machinery on exhibition. This engine was built at the Miner's Foundry, in this city. To the ordinary eye it may seem faulty in principle; but this impression is produced altogether from the novelty of its design and construction. It is as much unlike any steam engine heretofore produced as can well be conceived; yet, judging from its operations at the Pavilion, and from the reports of its performances elsewhere, it seems to give results quite satisfactory, both as regards economy and durability.

Among its most valuable features appear to be its simplicity, its small liability to get out of order, and its exceedingly light weight—as this engine, complete, does not weigh more than the mere fly-wheel to an ordinary engine. These advantages are especially important in connection with engines designed for use in the mountains, at a distance from machine shops where repairs can he made, and where the skilled labor of either machinists or engineers is difficult to be procured. The small weight of the engine, in proportion to its effective working power, is a most important consideration, where it is necessary to transport machinery a long distance, and over rough roads.

The inventor of this engine claims for it the entire principle and action of the best reciprocating engines, while its details are so far simplified that the pistons connected directly with the crank form the only moving parts; and these, with the cylinders and bearing parts compose the whole engine. It would be impossible to convey to the reader, who has never seen the working parts of the engine, any intelligent idea of its construction and principle of working without full illustrations. This engine forms quite a novel and interesting feature in the Exhibition.

The engine exhibited by the Pacific Foundry was fully described and illustrated on the first page of yesterday's issue.

In continuing our notices of motive powers, we come next to water-wheels, windmills, etc., which we shall endeavor to complete in our next issue.

WATER WHEELS.

It is to be regretted that none of the numerous inventors or proprietors of water wheels have seen fit to exhibit at the present Fair. The omission is quite noticeable.

WINDMILLS.

Before the days of steam, the wind mill was a great institution; even now, in many parts of Europe, it is extensively employed for grinding, sawing, expressing oils, working pumps, etc. It is but little used in this country, except for pumping. Among all modern improvements, since the days of the redoubtable Sancho Panza, few have been of more practical value to agriculturists and horticulturalists, especially to such as reside in poorly-watered districts, than this simple device for obtaining power. The crude structure of a century ago, with its huge arms, seldom more than four in number, and requiring a massive structure for its support, bears but a slight resemblance to the elegant and simplified structure of to-day.

The windmill, while it performs all the offices of steam, except where an exceedingly uniform motion is required, consumes no fuel, requires next to no attention, and is of but trifling cost; but catching the breeze from any and every quarter, it brings it in quiet subjection to man, and employs its power in various ways, but, most of all, to dispense the aqueous blessings of heaven to the thirsty soil, or grateful beast.

Only two specimens of this useful device are on exhibition at the Pavilion—one of which is of model size, manufactured and sold by E. O. Hunt, Nos. 114 and 116 Spear street. This is shown inside the Pavilion, near the center of the machinery department. This mill revolves on its center to receive the wind from any direction, and is so constructed that it can be readily stopped in the strongest wind, by the gentle application of a brake. It is built in five sizes, with arms from eight to twenty feet in diameter.

The other is of working size, and is exhibited outside of the Pavilion, and in operation just to the right of the main entrance. This mill was built by Atwood & Bodwell, 216 Mission street, and is well known throughout the State as a cheaply constructed, reliable windmill. Great numbers of them have been sold, and they speak for themselves to all who desire to procure such an article.

AGRICULTURAL IMPLEMENTS.

CLASS II.

The department of machinery affords more articles of general interest and attraction at the present time, to the wandering sight-seers at the Fair, than any other branch of the Exhibition. It is in the immediate charge of T. J. Winship, the engineer who traveled the revenue cutter Shubrick on an overland journey recently,—as the reader will recollect,—up in Mendocino county, and who was kind enough to walk with us through the subdivision of Manufacturing Machinery, in order to show us, in default of a list which there has not been time to make, what there is to be seen, and what is to be put in motion for the edification of persons interested and concerned.

A shingle cutter, by F. A. Huntingdon, is first met with. It consists of a circular saw, and some smaller saws at right angles thereto. The working of it will be described when they commence manufacturing shingles, which is promised as soon as they will be able to put it in order. A gas pipe and screw-cutting machine is on exhibition by J. Dougherty, which may he seen at work any evening. There are two competitory tire up-setters, for bending wagon tires, on exhibition by Mr. Robinson, and by Hughes, Campbell & Co. A new idea in the way of a blacksmithing hammer is presented by Peterson & Jones, being a large spring hammer worked by a treadle, spring attachment, while the smith holds the iron in his hands. A wire manufacturing machine is on exhibition by Mr. Hallidie. Faulkner & Co. are there with a complete set of type-molding machinery, which is at work turning out the letters as fast as they can he counted. A fancy loom from the San Francisco Woolen Factory is at work every evening in manufacturing shawls. Frank G. Edwards exhibits the paraphernalia for printing wall paper, and shows a variety of specimens. A fine display of circular and other saws by the Pacific Saw Manufacturing Company, completes the list on that side of the building.

The Agricultural Implements are classified as a subdivision of Class II, Manufacturing Machinery, though it is a matter of protest on the part of the agriculturists, who claim to stand one degree farther back, nearer to nature, and amongst the producers.

The articles especially worthy of examination are Hunter's Grain Separator, a machine taking the place of the fanning mill, but without the use of wind as an agency. There is a vertical percussion in connection with variously sized sieves. Two hay presses are on exhibition: Price's, which was shown also at the last Fair, and Gillivrae's, manufactured by H. G. Pratt. Of gang plows there are a number: Holloway's, of Eastern manufacture; the Sweepstake, manufactured at San Leandro; Ingham's Sulky Gang Plow, a California invention; and the Decator Gang Plow, from Hanley's establishment. A cotton gin and condenser, and Pitt's Improved Separator are on exhibition by Baker & Hamilton. Ready's Everlasting Cultivator Tooth is hung up on a string. C. A. Fargo shows an ingenious wagon-brake, which elicits for him the congratulations of everybody who stops to examine it. Two important desiderata are gained, viz: great power at easy control, and the removal of the brake block so far from the wheel as to escape all clogging in muddy weather. The principle applied is that of shifting levers, and its operation is very simple. The brake costs very little more than the ordinary brake, and it will save its price in two months in horse flesh. A seed planter is exhibited by Winter; a self-raking reaper and mower, by Russell Erwin Co. A variety of articles are shown by W. N. Hawley, viz: a feed cutter, a Parlin & Orendorff Plow, a Smith's Turf and Stubble Plow, a Buckeye Mower, and another mower with a self-raking attachment. F. B. Lamb exhibits Wellington's Vegetable Cutter, a coffee mill-shaped machine, with semi-circular knives in the place of the teeth in the coffee mill. The Staudish steam plow will be noticed in full hereafter.

STEARINE CANDLES.—There are very few persons who have any correct idea of the processes animal fat undergoee before it is converted into the beautiful, snowy white candle. The articles exhibited by the California Candle Factory, illustrate these changes in a manner that none can fail to understand. There are large cakes of fat which are converted into a substance about as black as asphaltum, which ultimately become as white and flakey as snow. The candles made from this material are as hard and bright as if made of porcelain. The California made candles deserve the high character they have attained. The fat of California-raised cattle makes better stearine than those raised in the Northern or Western States. This curious fact partly explains why these candles are so superior. But the skill of the workmen employed has much to do with the matter.

NAHL'S JOAQUIN, in the Art Gallery, attracts a great deal of attention. It is the most spirited thing in the exhibition. The robber is represented as being fired at, and escaping from a body of pursuers in a cañon at dusk, by riding up on a rocky ledge at the side. His expression, on the canvas is remarkable, showing Nahl to be an artist of great power, and accustomed to study his subjects closely from life. Joaquin was an ordinary wild greaser, such as we see everywhere in the pack-trails. Robber life is not yet a thing of the past in California, though it is now confined to a few localities in the vicinity of mountain thoroughfares, whence we occasionally hear of striking incidents, which, however, are taken as a matter of course by the residents. Characters of a very picturesque description might be picked up by such artists as Nahl, in some of the half-deserted mining camps that we could direct him to.

GIFFORD'S BIRDSEYE VIEW OF THE CITY AND COUNTY.—At the southern end of the Art Gallery, the visitor will see a well executed birdseye view of the City and County of San Francisco, showing every feature of the topography of the entire peninsula, as well as all the architectural landmarks and prominent buildings and institutions of the city, the names of which are located by an accompanying reference chart, or key. An excellent idea can be formed from it of our geography and surroundings, and it will be interesting especially to look at before making a visit to the ocean beach, or the southern limits of the county, or to the Laguna. G. H. Montgomery has undertaken the canvassing of the city for the artists, Messrs. Gray & Gifford, and the price has been fixed at four dollars.

EXAMINE the goods of the Womens' Coöperative Union, near the fountain in the Pavilion, if you have not done so already, at their store, No. 39 Second street. They make a fine display.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Weekly Stock Circular.

Financial.

Gold in New York, August 14th, 3 P.M., 146⅞; Sterling 199@199¼.

Money requirements in our local market are decidedly brisk, both for ordinary mercantile and crop accounts, but the supply is fully equal to the improved demand, imparting a sense of repose and confidence in business circles. Good double-backed paper continues to be done in bank at the crystalized rate of 1 per cent. per month, single endorsements ruling ¼ per cent. higher. The demand at the savings banks for loans upon mortgages exhibit the employment of a larger volume of capital, the available funds of those institutions being considerably reduced. These transactions are effected at 1 per cent. per month. We are under the impression that the recent remarkable fluctuations in gold in the New York market induced some parties to remit rather too heavily, in anticipation of future Eastern obligations.

Gold bars are in light demand, and are quotable at 880@890; silver bars are abundant, from par to ¼ per cent. premium; currency bills on Atlantic cities rule from 44@45¾ per cent. premium on gold, being a rise of 1 per cent. since the 6th August, and 3 per cent. since the 30th July: sight drafts, payable in coin, ¾@1 per cent. premium; telegraphic transfers are offered at 1@1¼ per cent. premium; sterling exchange, 48¾@49d; commercial do, 49¾@49½d; Mexican dollars, 50@6 per cent. premium, with active market on Chinese account; exchange on Paris, 5 francs for thirty days.

The following were the several balances in the State Treasury on the 1st of August:

General Fund	$26,390 49
School Fund	38,841 03
Interest and Sinking Fund, 1857	51,382 11
Interest and Sinking Fund, 1860	7,801 10
State Capitol Fund	3,748 97
Military Fund	8,639 20
Soldiers' Relief Interest Fund	6,594 80
Pacific Railroad Fund	7,829 32
Soldiers' Bounty Interest Fund	19,773 83
Line Officers' Interest Fund	50 72
Insane Asylum Fund	1,922 22
Swamp Land Fund	132,711 85

To England	141,416 06	
To France	32,587 17	
To Panama	10,000 00	
		363,211 01
Total since August 1st, 1868		$1,970,474 71
Previously this year		23,231,910 12
Total since January 1st, 1868		$25,202,384 83
Corresponding period 1867		26,822,585 31
Decrease this year		$1,620,200 48

City Stocks.

The market for shares other than mining shows considerable activity, and the transactions exhibit an advance over previous sales. San Francisco Gas stock is in demand, selling at $78 50@78; Spring Valley Water realized $66, seller 30; Pacific Insurance Co. stock rose to $120, seller 30; Union Insurance sold at $89 50. Twenty shares of San Francisco Insurance Co. stock sold at $105 per share. The following monthly dividends have been declared since our last issue: California Steam Navigation Co., 1½ per cent.; Omnibus Railroad, ½ per cent.; North Beach and Mission Railroad ½ per cent., and The Bank of California, ita usual 1 per cent.—all payable on and after to-day.

The first annual meeting of the German Savings and Loan Society was held on the evening of the 10th inst., when the following named persons were chosen Directors for the ensuing year; L. Gottig, M. Mendheim, Geo. H. Eggers, Fritz Koester, Jacob Gundlach, Claus Spreckels, Henry Schmiedell, Fr. Roeding and C. F. Mehius. Subsequently, C. F. Mebius was re-elected President; G. Wetzlar, Secretary, and John R. Jarboe, Attorney.

The San José Railroad Co. held its annual meeting on the tenth, when the following persons were chosen Directors for the ensuing year: H. M. Newhall, Charles Mayne, Peter Donahue, Lloyd Tevis, W. C. Ralston, Myles D. Sweeney and James O'Neill. H. M. Newhall was re-elected President; W. C. Ralston, Treasurer, and J. L. Willcutt, Secretary. The Company is reported to be in a much more prosperous condition than at any previous period. The railroad between San José and Gilroy, a distance of thirty miles, is being carried forward, and it is thought will be completed by the end of the year.

Mining Share Market.

The mining share market since our last similar reference has been somewhat irregular, prices showing a material decline. This downward tendency has brought a considerable amount of stock into the market, and the transactions—mostly of a speculative nature—have been quite large. Under this recession outsiders are disposed to enter the market more freely to benefit by the reaction which is sure to follow a very noticeable decline. Stocks are now repeatedly resold upon a trifle advance, and in such cases the sales do not involve a corresponding amount of money, but merely the advance or decline upon first purchases.

The Reese River *Reveille* published a tabular statement of the average bullion yield per ton of forty-one mines located in that region for the quarter ending June 30, 1868, from which we learn that the highest average is $995 and the lowest $78 per ton. The number of tons of ore reduced during the quarter amount to 2,173½, against 1,753 for the previous quarter. The total yield of this number of tons is $410,110 48, and the average yield per ton is $188 50—the computations being in currency. The total product of the previous quarter was $318,825 29, and the average yield per ton was $181 87. The present table compares favorably with those of the previous quarters. The bullion shipment from the office of Wells, Fargo & Co., in Virginia, Nev., for the month of July aggregated $661,387 80, against $689,501 02 for June—being $28,114 12 less than for the previous month.

SAVAGE—has been largely dealt in, falling from $129 to $106, and at the close sold at $110½. For the week ending August 8th, the yield of this mine was 943 tons, showing an average assay value of $37 18, against 1,184 of an average production of $40 36 to the ton the previous week. This has been the smallest weekly yield for some months, and is said to be partly due to the bad condition of the ground, which required speedy attention. In the north mine, from the fifth station, there is no change in drift or cross-cut, and the ore is reported to hold out well in raising up under the sills of the "five points." In the south mine, same level, the cross-cut has not yet reached the east clay. Winze No. 1 goes down slowly in very hard rock—quartz and porphyry; while No. 2 has been sunk fourteen feet through very good ore. The north drift from the sixth station shows no change, and is now forty feet from the forks; while the south drift, from forty to forty-five feet from the forks, is said to be coming into some quartz and ore, and upon this the Superintendent remarks that they are still 140 feet from where he expected to find ore. He hardly knows what to think of it, as it does not resemble the ore on the fifth station. A dividend of $10 per share is payable since the 11th. The July dividend was $15 per share. A telegram of August 13th says that they have had no serious trouble in the south mine this week, and are gradually getting faces opened again.

CROWN POINT—dropped from $87 50 to $72, improved to $77, and closed at $78. A telegram of August 14th states that the drift from the 900 level was in 140 feet, and the winze from the 800 level had attained a depth of 74 feet. The stopes between the 700 and 800 levels furnish the principal supply of ore, showing no change for some days. The daily ore product is now from 100 to 120 tons. The July receipts of bullion amounted to $145,923 against $116,000 in June, and the expenses foot up $79,348. For August account $9,800 in bullion has been sent forward. A dividend of $5 per share is payable since the 12th inst.

KENTUCK—has been in moderate request, opening at $383, then selling at $350@355 ex-dividend, and closing yesterday at $375. The aggregate receipts for July foot up $138,860 against $120,766 in June. For August account the receipts have been $10,404.

YELLOW JACKET—sold largely at fluctuating rates, rising from $1,080 to $1,165, receding to $1,145, advancing to $1,180, falling to $1,090, and closing at $1,125. The *Trespass* of the 8th inst., has the following: "The crosscut of the drift from the 810 level has passed through a body of quartz forty feet wide, with ten feet of good ore, and has penetrated into the east country. The drift is now being run south, and will follow this stratum of ore to the Kentuck line. The hoisting works at the old north shaft will soon be put in order and work re-commenced in the north mine. The hoisting works at the new shaft are also being overhauled; the present system of brakes is to be done away with, and the hoisting will be done by steel wire cable and reverse engines."

CHOLLAR POTOSI—declined from $138 to $130, and closed at $135. During the week ending August 7th extracted 760½ tons of ore. With the additional force employed they will increase the yield of the Blue Wing stope from 30 to 40 tons per day. On the 7th inst., the drift from the 1,000 level of the new shaft was in 132 feet; and the southeast branch of drift from 1,100 level was 56 feet in length, running in hard rock, and the northeast drift was in 73 feet.

AMADOR—has been on the market to a larger extent than usual, declining from $260 to $217 50, and closing at $233. Nothing from the mine to cause this fall. They have recently expended considerable money in the purchase of real estate and mill property, as well as for the construction of a dam, etc. A dividend of about $4 per share may be expected for the present month.

SIERRA NEVADA—sold at $38 75@34 50, closing at $36. On the 7th the east drift on the 710 level was in 60 feet, and the west drift 45 feet, having hard quartz and much water to contend with. The 20-stamp mill nearly completed for this company will soon commence to crush. They are taking out about 50 tons of ore per day with only five miners. ....ALPHA rose to $51, declined to $45, and closed at $46 50. The drift from the 250 level has been carried to the last post in the old timbers, running in a very hard gray porphyry, and as soon as they are far enough ahead will make a turn to the south. The Imperial is said to be finding pay ore on both sides of the hard belt which this company is getting into.

IMPERIAL—has been rather quiet at $112@106, closing at $107. The 700 level of the Alta shaft is said to be improving. Nothing as regards the lower level of the new shaft. On the 13th, $0,516 was sent forward; this decreased yield is due to the temporary stoppage of the mill....OPHIR sold at $20 50@18, closing at $19 50. The new shaft was 380 feet deep on the 12th; rock still hard, with some indications for a favorable change.

The sales in the Board during the past week have been as follows: Open sessions, $955,638; regular sessions, $1,943,089—total, $2,583,727.

CANADIAN MINING.—The Toronto *Globe* complains of the arbitrary suspension of sales and threatened exaction of a royalty, by the government of Ontario, on the products of gold and silver mines which have been discovered along the north shore of Lake Superior, as being the cause of their retarded development.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Aug. 14, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

			Per ton.				*Per ton.*
12	per cent.	ore	$16 00	22	per cent.	ore	$43 56
13	"	"	18 62	23	"	"	46 45
14	"	"	20 20	24	"	"	49 37
15	"	"	23 35	25	"	"	52 22
16	"	"	28 2-	26	"	"	55 11
17	"	"	29 12	27	"	"	58 00
18	"	"	29 91	28	"	"	60 80
19	"	"	34 90	29	"	"	63 77
20	"	"	37 78	30	"	"	66 66
21	"	"	40 67	31	"	"	60 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

RESOURCES OF LOWER CALIFORNIA.—Mr. Gabb, in his notes on Ross Browne's expedition to Lower California, says copper and gold exist in nearly every part of the territory, as well as the baser metals, which are not worth looking after; and coal is reported, but it is probably asphaltum. Three places are noted for salt: San Quentin, Ojo de Liebre and Carmen Island. Many little valleys and nooks exist among the granite mountains of the South still unoccupied, and which could be brought into luxuriant cultivation.

SAILING CRAFT.—The fleet of very well-behaved and orderly sloops which the visitor will see sailing around the circular fountain, like Commodore Stringham's war steamers before Fort Hatteras, are really propelled by the wind. There is a current of air caused by the falling of the water, which blows outward from the center of the fountain.

GO AND SEE Tustin's Patent Adjustable Windmill, at the junction of Mason and Turk streets with Market. *

THE UNION FOUNDRY steam engine furnishes the power this evening at the Fair.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, August 1st: The Morning Star Co. have completed their road from the dump to the shaft, and lumber is being hauled over it.

The work of putting in the machinery of the Monitor Consolidated mill is progressing finely. The crusher is in position, and to-day the workmen are at work on one of the pulverizers.

Chronicle, August 1st: Orders have heen received here to clean out the shaft on the Knox claim, which is a southern extension of the I. X. L., preparatory to commencing work on it. The work will progress under the superintendency of Wm. Kent, of this town.

Amador County.

Jackson *Ledger*, August 8th: Steve Kendall has commenced operations on his sulphuret mine on Grass Valloy creek. Thoss' sulphuret works jog steadily along, and we hear he has been successfully testing ore from several of the West Point mines.

Sunday last, they cleaned up at the Coney & Bigelow mill, after a run of twenty days, and the yield was the largeet ever taken out in the same length of time.

The proprietors of the Casco mine have at last struck the ledge, and it is looking well.

The famous Anaconda mine at Pine Grove, after having lain idle for some time in consequence of inability to keep out the water, has been cleared of its superfluity. and good quartz is heing taken out, to be worked at the Italian mill ou Else creek. A large amount of refuse rock is also heing crushed.

Calaveras County.

Mokelumne Hill *Chronicle*, August 8th: In old Rich Gulch, Staples & Co. have struck a vast body of very rich ore in the Palomo mine, and are actively engaged in erecting an additional battery to the one already in operation. At present, the company have but 8 stamps employed; hut their motive power being of sufficient capacity to run 16, they will soon have that number crushing. The company are also contracting for the erection of another mill on their mine. Alexander & Co., in the same district, are still taking out ore in large quantities. Their mill has been in operation considerahly over a year, and has paid romarkably well from the day it started. Norton & Co. have suspended operations for a few days, but will speedily resume labor upon their mine. Homer & Co., proprietors of the "Quaker City" mine and mill, near the Junction, have commenced crushing. Their mill has a battery of 10 stamps. At Railroad Flat, Mr. Said, proprietor of the "Petticoat" lead, has been crushing rock which yielded $100 per ton. He has two shafts sunk on the lode to the depth of 100 feet each, and is at present engaged iu driving a level to connect them.

San Andreas *Register*, August 8th: The owners of the Sciefiard claim will begin operations immediately upon their mine. Their prospects are good.

We are informed that a company of San Francisco capitalists are about concluding arrangements with Mr. Thorne, for the working of the Ben Thorne quartz mine.

Kern County.

Havilah *Courier*, August 1st: The Kernville correspondent writes: Wadligh's new 10-stamp mill was started upon Wednesday last. It has capacity sufficient to crush from 25 to 30 tons of rock daily.

The mills of Ellsworth & DeLand and Hutton & Co. are admirahly arranged. Their ore is extracted cheaply and pays well.

Evans' furnace has heen in blast some time, and bas roasted 30 or 40 tons of tailings for the chlorine process. He has just received his apparatus for generating gas to put theee roasted sulphnrets through the chlorine process. He will soon have everything iu readiness, when he will be ahle to work up three or four tons daily.

T. J. Oders' mine—the Queen of the West—at Sandridge, ahove the Kern River Miuing Co.'s mill, makes a good showing. Oders is down 25 or 30 feet on his lead. His first grade of ore yields $204 a ton; second grade, $60 per ton.

Los Angeles County.

News, July 31st: Miller writes us from the Soledad mines, that the mines are very rich, the lodes large and well defined. New works are being built, and the camp has every evidence of prosperity. A large number of new claims have heen taken up, and prospecting is goiug rapidly forward. A substantial report from that quarter, in the shape of solid gold bars, is expected before a great while.

The *Alta* of this city, of a late date, says: A quantity of eilver ore from the Zapata mine, Los Angeles county, near the place where gold was first discovered in California, was brought here by the Orizaba for reduction. This ore closely resembles the best from the Comstock lode, Nevada, and it is believed that it will work very rich. The mine is owned by Dr. Winston, one of the pioneers of California.

Mariposa County.

Gazette, August 7th: The Pedro Goza mine, situated on Bear Creek, belonging to Bogan & Co., of this place, has been yielding splendidly for some time past. The last clean up, after a run of five days, netted $1,800; thirty-six ton of rock was crushed. Owing to a scarcity of water, the mill is not now running; to take advantage of the scarcity, the proprietors propose to erect a dam, which will enable them to run ten hours a day.

The Phillips copper mine, at Buchanan Hollow, has changed hands. Improvements will be made in the emelting works, aud an additional number of hands will be added; all of which will increase the amount of ore raised and smelted, and insure a euccessful and profitable working of this valuable mine. We understand that the copper mine situated at James' ranch, known as Nelson & Co.'s, will soon commence operations.

Nevada County.

Transcript, August 5th: The American Co., at Birchville, after a run of 24 days, made a partial clean up on Saturday last, and took out $12,000.

August 6th: The miners at South Fork, near Eureka, are doing first rato. Recently, the Gem mine was opened by Cowles, Palmer & Co. It is located near Black & Young's mill. They ran a tunnel 65 feet, struck the ledge, and took out 26 tons of rock, from which they cleaned up $873 50, after crushing at Black & Young's mill.

Tho Birchville Co. have struck the ledge in their new tunnel, and are now prepared to take out rock. The Birchville Company have heen working a year, and have never levied an assessment, the rock paying well from the surface.

Sweet & Co. have uncovered enough of their ledge to take out 200 tons of first class rock, which looks well, and will be crushed at Palmer & Everingham's new mill. The mill will be running in two or three weeks.

Mulligan is also taking out fine rock from a four foot ledge, which will he crushed at the new mill.

The Jim mine is being worked, and the rock ohtained is looking first rate.

August 8th: The cement mill erected some time since in Marselus & Maltman's claims is being removed to Eddy's claims, at French Corral.

A 12-horse engine for the hoisting works of the Kansas Co. arrived in this city on the way to the mine, on Thursday night, consigned to A. D. Allen, the Superintendent. The Bansas ground was recently purchased by Mr. Allen, and work has already been commenced upon it.

August 9th: There is now considerable activity in mining matters throughout the ceunty. Machinery is being fitted up on a number of claims, and in others the capacity of machinery is being increased. During the past week a number of teams have passed through town loaded with material for mills and machinery in other parts of the county, and some new works are heing put up in this township.

The Rising Star mine, on Deer Creek, is yielding handsomely. In sinking their incline the company recently struck a new vein above the old ledge, which is 20 inches thick, and from which good rock is being taken.

August 11th: The Bloomfield Gravel Mining Co. are engaged in building a large ditch to carry water to the mining camps along the ridge, and they are also engaged in mining operations.

Gazette, Aug. 6th: About a month ago we recorded the purchase, by J. E. Squire, W. W. Cuzzens, G. R. Atkins and Martin Whie, of the ditches and mining ground known as the Gardner property. The same parties have now purchased of Thomas Findley the mill, mining ground known as the Pond and Remington claims. The purchase price is $35,000. The several purchases embrace all the ditches, mills, and the bulk of the mining ground on the Little York ridge.

Grass Nalley *National*, Aug. 7th: The last crushing of rock from tho Seven-Thirty mine was eminently satisfactory to the fortunato owners. Twenty-two loads of rock were crushed at the Gold Hill mill, and at the clean up yesterday over $1,100 were realized, being an average of $50 to the load.

Wm. M. Eddy & Co. are erecting a 15-stamp mill at Freuch Corral, for the purpose of crushing the auriferous cement which abounds in that locality.

August 10th: A rich strike was recently made at Osborne Hill.

Plumas County.

Quincy *National*, July 25th: Mr. Gamblin has sold his mining claim on Rich Gulch to Messrs. McBeth & McNeally, for $1,050.

Courser & Co. have commenced cleaning up bedrock. The water has failed at this place, but will last for some time yet at other points in the viciuity of Twelve-Mile Bar.

The Greenville correspondent writes: Mining items are scarce. Wilson Bros. have been running for a ledge for some time, and have just got in. They are taking out some good rock. Taft, Waterworth & Co. are doing very well in their surface claim, near the Indian Valley mills.

Aug. 1st: Kober, Stevens & Co. are working a river claim on the Middle Fork, at a point above Peoria Bar. They have good prospects.

Mr. Henry White is putting a wing-dam in the river, a short distance above Nelson Point. He got a fine prospect in the claim, last fall and it will prohahly pay hig when he gets it dry.

Sierra County.

Downieville *Messenger*, Aug. 8th: The Good Hope recently worked 50 tons of rock from their mine in the Montpelier mill, the ore yielding $20 to the ton.

The Port Wine correspondent says: The Monte Cristo Slope Co. are doing first rate, taking out more than donhle wages.

The Eagle Co. is doing first rate also, at present.

Tulare County.

The Tail Holt correspondent writes: Tho mines in this vicinity are developing remarkahly well this summer. The Sarah Campbell, owned hy Carter & Co., has exceeded their most sanguine expectations, both in the richness of the ore taken out and in the size of the lode. Malthy & Biggs aro extracting large quantities of ore from their Eclipse lode, and a portion of it of unprecedented richness. They are getting rock on hand for another big run.

Dr. James has been prospecting and working two of his lodes for several months past, both of which give evidence of heing two of the best lodes in the vicinity. Mr. Bullock, of Grizzly Gulch, is still at work on his placer claim and is doing well.

Times, Aug. 1st: Mr. Wadley, who has the Ellsworth & Deland's mill, on Kern river, made a run of a little less than a week, and cleaned up $1,840. New developments in these mines give indications of their becoming as rich as any in the State.

ARIZONA.

Prescott *Miner*, July 25th: A party of prospectors left Wickenburg, last week, to hunt for gold in the mountains on the north side of the Gila, between Agua Caliente and Gila City.

We learn that times at La Paz are good. A dry washing company has been organized, and are at work on good gravel. There was some talk of erecting a quartz mill in the vicinity of La Paz. Mr. Sparks informed us that several hundred pounds of rock from the lode near King's Wells, upon which he hae been to work for some time past, were sent to San Francisco eome time since to be tested.

Groom, Cole & Little have gone to the Sterling mill. They will sink a shaft on the Platauka silver lode.

A conditional sale of the Sterling mine has been made to parties, who will go to work on it inside of 50 days. The sum to be paid is $30,000. The gentleman who made the purchase intends to work the rock by the chlorination process.

Work upon the Chase lode is being pnshed forward vigorously. Another tunnel has been started. The water comes in fast in the old tunnel, and eome spots have to be timbered. The ledge is looking well in hoth tunnels, but is largest in the new.

Owing to the wet, damp weather, which, no douht, makes the air bad in the shaft, work upon the Chloride has been for the present suspended.

Mr. Davis has sold the Mitchell mine, in Mohawk County, to the Pittsburg and California Gold & Silver Mining Co., who are now erecting a mill, etc., to work the ore at a point on the river, five miles below Mohave City. The Mitchell will average $30 to the ton. Mr. Hardy and others at that place are operating upon other mines.

COLORADO.

Georgetown *Miner*, July 23d: Several very promising silver veins have heen discovered iu Boulder Conuty the present season....John T. Herrick commenced cupelliug on Tuesday evening last....Col. Hale is raisiug a large quautity of very superior silver ore, from the Griffith lode, one of the old gold discoveries. He is also developing the Mills County lode....Huepeden, Wolters & Co. have shipped, since our last report, 1,007.40 ozs. of silver bullion, coin value $1,109.94....It is rumored that extensive and valuable gold diggings have hcen struck in the vicinity of Georgetown. ....Tho Knowles furnace, with which experiments have beeu made in the Lyon's works at Black Hawk, has been very euccessful in smelting the ores of that section, and arrangements are now being perfected for its introduction in this district. ....Tom Munsell has just discovered a new and very promising vein on Leavenworth Mountain, the show of mineral in it beiug very good, right at the surface. Pearson & Fellows are driving an adit on the Awanda lode, on Leavenworth Mountain. They have a large vein of argentiferous galena, from which we have seen some very fiue specimens. Tufts & Baxter are opening a fine galena-bearing vein on Sherman Mountain, that is producing some very fine ore. Gen. Marshal has shown us some very fine galena and sulphuret ore from the W. B. Astor lode, on Leavenworth Mountain. The Marshal tunnel cuts the vein on the surface only.

Central City *Register*, July 23d: The owners of the Astor lode have struck a fiue pocket of sulphuret of eilver, which is extremely rich. C. T. Sabin ran a small lot of ore from tbe Champion lode, last week, that yielded $70 per ton, coin—$420 per cord. There is a good vein of this kind of ore in the mine, and it will probably be worked this summer. The new mill of the Barrett Co., on the Winnebago lode, has heen pounding away quite husily for several days, and is doing finely. Yesterday, 31 ounces of hard amalgam were cleaned up from one cord of ore.

We have seen some ore from the Gilpin County tunnel, which was the finest silver ore we ever eaw. It is largely made np of horn silver. The ore is a chloride, and contains upward of 75 per cent. of the metal. When rubbed with a moistened polished knife blade, it at onco presents the metallic lustre of pure silver. This sample of ore would douhtless assay several thousand dollars per ton, and an assay might be made from it which would yield $15,000.

Denver *News*, July 22d: Col. Tannatt is going to put 40 stamps into the mill bnilding of the Rocky Mountain Co., at Mountain City. Two pans of the pay gravel of the South Park, of which there are at least 20,060 acree, were prospected in our presence, and the gold melted into an assay button. It weighed one dwt. and three grains, worth 90¼ cents in gold.

The Montezuma correspondent, Summit County, writes as follows: Donnelly and O'Donnell are opening their lodes on Nigger Hill, Bevan District. They have six lodes ehowing more mineral than any other six lodes in the county. From a shaft on the Bunker Hill, fifteen feet in depth, five cords of galena has heen taken, some of the pieces weighing from 200 to 450 pounds. Andy Peddie still has his big run in Negro Gulch. He is also working some silver lodes on Nigger Hill. Illinois Gulch is being mined by McCartney & Co., and the usual pay taken out. In French Gulch, mining is carried on with great activity. Four different fluming companies are hard at work, and taking out good pay. McFadden & Madden, Sisler and Mower, are working in Stilson Patch. Rippey, Clark, Iliff and Tood are working in the gulch near Lincoln City. All hands are realizing large wages. Somo new comers are about to lease Capt. Walker's stamp mill at Lincoln City, to work ore from lodes near the city. Aaron Hopkins is mining in Corkscrew, taking out good pay. In Gold Run, John Shock, Peabody, Mumford, Eherlin, etc., are hard at work and getting good pay. Governor Steele and Col. Harbor are at work on Delaware Flats. Work is also being carried on in Buffalo Flats. Christian, Breece & Co. are working Galena Gulch, which has been laying idle for a year or so, and are taking out larger pay than ever before. New and rich diggings, in Soda Gulch, on the Blue River, about eight miles below Breckinridge, are being worked by W. P. Pollock & Co. The finest gold now heiug taken out in the country is from this gulch. It coins near $17 to the ounce.

Same, July 29th: Gentlemen recently from Georgetown say mining affairs in that section are prosperous. Many are opening lodes, getting out considerable rich ore, and making improvements. The emelting works are being enlarged and somewhat altered, to meet the increasing demand on them.

DACOTAH.

Sweetwater *Mines*, July 25th: We were over to Yankee Gulch the other day, and found them all doing well. Wilson & Co. are taking out from 8 to 15 ounces per day, and only working two or three hours either. They took ont a fine nugget recently, weighing but a little less than $100. If they

had sufficient water to work the gulch as it ought to be, there would hardly be any limit to the amount of dust they would take out.

In Spring Gulch they are doing very well considering the scarcity of water. Messrs. Hincelin, Poire, St. Ledger and Neall will have their four-stamp mill completed and at work next week.

The Empire Co. is continning the work upon their ledge, and have a shaft down to the depth of 18 ft., four by six feet wide. The vein has gradually widened since the commencement of work upon it, and is now four and a-half feet wide. They are taking out nothing but quarts, the vein being wider than the shaft at the surface. The character of the quartz is excellent, some of it exhibiting free gold in abundance.

The owners of the Jennie Worrel Lode, in Shoshone district, have a shaft sunk upon it 18 feet deep, disclosing a vein two and a quarter feet in depth, with both wall rocks in view, making it thus far a well-defined ledge. The company are actively at work developing its richness, and will soon have out 75 or 100 tons of ore to be crushed in arastas.

IDAHO.

Lowiston *Journal*, July 18th: Another party of prospectors for quartz lodes, left here on Thursday last. They will examine the country about the headwaters of the Polouse River.

Owyhee *Avalanche*, Augnst 1st: The machinery for the Ida Elmore hoisting works has arrived.

MONTANA.

Helena *Post*, July 31st: Just at present the gold trade of Helena is very lively, and the brick manufacture is correspondingly brisk. On Monday, Prof. Steitz, at the First National Bank Assay Office, smelted half a dozen bricks, weighing in the aggregate 1,450 ounces, worth $26,742. One of these bricks is worthy of special notice on account of its size, its weight being 594 ounces, and its coin value $10,346. Another assay office, that of Mr. F. Bohm, smelted for the three days ending last night, 2,204¾ ounces of gold, worth in coin $52,-917. Their brick manufacture for yesterday alone, resulted in the sum $10,000. A large run was also made yesterday by Messrs. Molitor Bros., who turned out $14,000 worth of bricks.

Two large nuggets were found in Bear Gulch last week, one of them weighed five pounds, and the other was worth $500.

On Saturday afternoon Mr. F. Bohm, at his assay office on Main street, manufactured the largest gold brick that has ever made its appearance in the Territory. The bar weighed 1,346 ounces, or over 112 lbs. Its fineness was .882½, and its coin value $24,722.58. It was shipped to the East yesterday, per Wells, Fargo & Co., the expressage upon it alone costing $1,060.56. The gold dust from which this brick was manufactured was purchased, during two days only, at the banking house of Messrs. Bohm & Auh, 986 ounces of it having been bought of two miners from German Gulch. Messrs. Bohm & Anb report that an abundance of dust is being offered for sale, so that they are able to ship large bars by every coach. We understand that a $50,-000 brick is on the docket.

The Wm. Nowlan mill has recently been crushing upon the new quartz from the Cable lode, and cleaned up on Sunday last a lot of amalgam, which has been manufactured into a brick weighing 139 1-8th ozs., .829 fine, and worth $2,384.09. This brick is the result of a 5 days' run with 10 stamps upon the quartz referred to. Although unassorted, the rock yielded over $30 per ton, and it is thought almost fabulous results may be obtained by a careful selection of quartz for crushing.

One hundred and fifty linear feet of the Poor Man'e Joy ledge at Phillipsburg, are now exposed to view. Fully 1,000 tons of quartz are now in eight, besides 400 tons on the dump pile.

Water is rapidly subsiding in Confederate Gulch, and the work of reöpening the drain ditch is progressing finely. Thompson's Gulch continues to pay well. Benton Gulch is still being prospected.

Virginia *Democrat*, July 25th: Accounts from Norwegian Gulch are very flattering. Soguen & Co., in three days, with two men on bedrock, took out $300. A couple of nuggets, one weighing $90, and the other $50, have recently been found....Salmon River is paying better this season than it has been expected it would....Bedrock has been struck in the Grizzly Gulch drain ditch just above town, and $250 taken out in eight days' run.

A recent run on the Kearsage lode by the Postlewaite mill, cleaned up $60 to the ton. By selecting the rock more carefully it is thought that from $100 to $125 to the ton may be obtained. Specimens have been recently taken from this lead, in which the quartz was literally tied together by threads of gold....Rock is being taken from the Mesler, which will pay $75 per ton....The last sale of quartz on the Watseka lode was at the rate of $15 per foot.

NEVADA.

Esmeralda.

Aurora *Union*, Aug. 1st: The Kearsarge Co. at Independence, have cut a fine vein of ore seven ft. thick in their new draft.

On Monday last two large freight teams, loaded with Camanche ore passed through Aurora en route to San Francisco. One of the paties informed us that the company had shipped to Swansea 17½ tons of ore which would net them $250 per ton.

Humboldt.

Winnemucca *Argent*, Aug. 6th: Saturday last, J. M. White brought 1,938 ounces of crude bullion to town for shipment; was the run of less than four days on Golconda ore. The mill does good work and gives its regular weekly shipments of silver.

The Little Giant mine, Battle Mountain, is one of the best, if not the best, one in Nevada. First four and one-half tons crushed gave a yield of $160 per ton. The next batch was 22 tons, and the yield has exceeded expectations.

Reese River.

Austin *Reveille*, Aug. 1st: Wells, Fargo & Co. shipped from their office in this city during the month of July, 209 bars of bullion, weighing 16,001 pounds, and valued at $228,328 43.

Yesterday, Triplett, Superintendent of the South American mine, gave us a specimen of the ore which is produced at present from his works. The ore contains some base metals, but is of good quality, and is taken from a ledge four feet wide. During the past week the ore has been produced in large quantities, and as soon as the Manhattan mill is re-opened a lot will be sent there for reduction.

August 4th: J. W. Beard, who has just arrived from Tuscarora District, gives the following: Some prospecting was going on in the district, and new paying ground had been discovered; but at present the miners are not washing for want of water. The Beard brothers have the fullest confidence that a number of gulches and ravines in the district will pay from $5 to $10, and even $20 a day to the hand; and they have engaged in the enterprise of bringing the water from McCann gulch to the principal gulchee where gold occurs.

August 5th: A small bar of gold, weighing about five pounds, was brought into this city last evening. It came from the gold-bearing ledges of the Mammoth district, and is the product of ore reduced in an arastra belonging to J. C. Merrill & Co. The ore from which the bullion was obtained is said to be of a high grade.

Three bars of bullion, produced at the Knickerbocker mill, near Ione, were brought into the city yesterday afternoon.

August 6th: We saw to-day at the assay office of David Lundhom, five bars of bullion, of the average fineness of .946, and valued at $5,869.29. The bullion was produced at the Monte Cristo mill, in the district of White Pine, and was obtained from ore of the Hidden Treasure mine in that district.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, August 6th: The Gould & Curry Co. are vigorously engaged in the work of sinking their main engine shaft. It has now attained the depth of 1,020 feet, and is being deepened at the rate of 18 inches per 24 hours. No drifting will be done until the shaft is down 1,100 ft. A huge excavation some 30 feet long and nearly 20 ft. deep, has just been made for the foundation of a new 180-horse-power engine, which is to be used in pumping. The engine is one formerly in use at the company's mill.

A streak of excellent ore, some 18 inches in width, has been struck in the 700-foot level of the Imperial mine. As yet, the extent of the deposit is a matter of conjecture, but it is thought probable that it will lead to a large body above.

August 8th: The streak of good pay ore found the other day in the old 700-foot level of the Imperial mine, proves to be more extensive than was at first reported. It is five feet wide, and growing wider as it is sunk upon. The winze which is being driven down to the 900-foot level will follow the streak, and it is hoped that it may reach all the way.

The Alpha Co. are still engaged, it is said, in cleaning out the debris and sediment that accumulated in their shafts, drifts, winzes, etc., during the time the works were lying idle.

Wells, Fargo & Co. shipped from their offices in this city and Gold Hill during the past week, 14,010 pounds of assayed bullion, valued at $393,525.88.

Mr. Walter S. Hobart has leased the north end of the old Chollar mine, and is now preparing to extract ore for his mill. The old works, from which the machinery was taken out some time since, have been refitted.

Trespass, Aug. 4th: There was shipped from Wells, Fargo & Co's Gold Hill office this morning 22 sacks of bullion, weighing 1,948 lbs., and of the assayed value of $50,-534.60.

Aug. 8th: Dispatched from Wells, Fargo & Co's office in Virginia, this morning, four bars of bullion, weighing 202 pounds, and worth $6,000.

NEW MEXICO.

Santa Fe *Gazette*, July 25th: Mr. Shelby, who has just arrived from the Moreño mines, reports that good claims are being discovered constantly, and that more gold has been taken out of the claims worked this season than is generally believed.

The work on the Red River Ditch is progressing rapidly and will be concluded by the latter part of September.

Mr. A. Joseph, of Taos, one of the proprietors of the Last Chance claim in the Moreño mines, brought to the city last week, for shipment to the East, 318 ounces of gold. Mr. Joseph showed us a specimen of quartz taken from a lead found on the Last Chance claim which equals anything in richness we have ever seen. He states that several rich quartz leads have been discovered lately on gulch claims that are being worked. Water is getting scarce at the mines.

The *New Mexican* reports on the authority of a gentleman just down from Maxwell's, that the latter has a quartz lead that assays $19,600 per ton, and that he is about to put up a stamp mill to crush the quartz.

ORECON.

Dalles *Mountaineer*, July 31st: There is a rumor that new mines have been discovered on the Malheur River, and quite a large number of men have left for that locality.

Several men that went out with old Meek to look for the Emigrant mines, have returned. They say that Meek knew nothing about the country after they got to Stein's Mountain.

Portland *Oregonian*, July 25th: A letter from Cañon City states that it is the opinion of those well posted, that more gold will be taken out in that region this year than ever before.

A very rich streak of pay quartz was struck in Timber Gulch, Jackson County, last week. The rock was sacked at the lead and thus taken to the mill to prevent loss.

Last week, says the Roseburg paper, a party of our townsmen started to the Bohemian district. They went prepared to build and work an arastra, and thoroughly develop and test some of the richest leads.

The Motive Power at the Pavilion.—Messrs. Holmes and Coleman, committee on power and machinery at the Fair, have given instructions to Mr. Thomas Winship, Chief Engineer at the Pavilion, that the machinery shall ho run, on alternate days, by the three engines which have been placed in position as motors for the exhibition. Only one engine is to be connected with the main line of shafting upon any one day. Engines disconnected from the main shafting may be run at any time at the discretion of the Chief Engineer. This arrangement is a very proper one, as it prevents confusion, and will greatly aid in determining the relative practical workings of the several engines which are placed in competition.

Freight of Ores.—On a common road wheat would consume its own value if carried three hundred and fifty miles. In other words, it would be worthless at that distance from market, while by rail it can be carried three thousand miles at a profit. To state the matter differently, railroads multiply by ten the distance from any grain market at which its wheat may be raised. The same remarks apply, with evident variations, to other productions, as ores. We shall soon know what benefits can be derived, in this respect, from the completion of the Pacific Railroad, in regard to the permanence of some of the lead and other mining districts situated near the line of the route.

[From the Mechanics' Fair Daily Press.]

Our Industry and Destiny.

It is novelty and variety that entices and charms us as we follow our eyes through the details of an Industrial Exhibition. Instruction comes to us in a thousand shapes. We are learning something from every invention and device to meet the wants of man, which leads us so much further into that knowledge of natural laws, the acquirement of which seeme to be one of the principal objects of our being. As civilization itself is the child of our necessities, having been built up from its very foundations by the useful arts, so it is a truth worth bearing in mind in our visits to the Fair, that the varied contents of the building speak to us in a tone which compasses the entire scale of our human nature. It is Pantology made practical. We take in little facts here and there which operate in their silent way, and in many a subsequent case of practical application, assert themselves with mighty force. That the principle of these exhibitions is founded in the spirit of the age, will not be questioned when we recall their frequency and scope in modern times, and their engrossment of the world's attention, as compared with the tournaments and feudal pageants, the gladatorial contests and mythological rites which stood foremost in other times, whose character we can realize only as we realize a mountainous landscape in its distant parts, by those parts that are more near.

We have but to take a schoolboy's summary glance at history to be struck with the fact that the different ages and peoples which stand as our ancestors in civilization, had widely different missions; that while Greece developed the beauty and nobleness of humanity in its youth, Rome exhibited its concrete grandeur as shown in statesmanship, France its flexibility and universality, Germany its trait of striving to fathom the unknown, England its practical combination and application of all the preceding to the reclamation and mastery of the world. We can feel and know that our land likewise has its own destiny, for it is already outlined—a destiny which will loom up as picturesquely in history as the story of its first discovery, and which will prove as different in effect from that, which has been developed by the human life of the old world as our continent lies separate and apart from that, between the Eastern and Western oceans. The nation that sings a national hymn like that which was sung at the opening of the Exhibition on Saturday by many hundreds of school-children, whose pure voices mingled with the clear and living masculineness of the trumpets of the orchestra—has surely its own peculiar burthen, and noble end to accomplish:

> My native country! thee,
> Land of the noble free,
> Thy name I love;
> I love thy rocks and rills,
> Thy woods and templed hills;
> My heart with rapture thrills,
> Like that above.

While we are occupying ourselves with the engrossing details and the vanities of our own little exhibitions—acting our part as individual motors in the several branches of industry and effort which have fallen to our lot in the development of the coast, by virtue merely of our necessities, let us not overlook why we have been created with such necessities; why it is that the successful are rewarded; and wherefore it may some day come to pass that California, the land of manly adventure, the home of the fabulous modern golden fleece, with its snowy mountains and its sunny oat hills facing the Orient, shall be required to play the crowning and impressive part in the destinies of our age of the mechanic arts.

Removal.—Our friends will please bear in mind that the Mining and Scientific Press Office, Patent Agency and Job Printing Office has been removed from 505 to 414 Clay street, about half a block below Sansome.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

Notice.—The partnership of C. W. M. Smith, W. B. Ewer and A. T. Dewey, has been dissolved this day by mutual consent. The Patent Agency and Newspaper Business of the MINING AND SCIENTIFIC PRESS will be continued under the firm-name of Dewey & Co., by A. T. Dewey and W. B Ewer.

San Francisco, August 1, 1868.

San Francisco:

Saturday Morning, Aug. 15, 1868.

Notices to Correspondents.

DECORATOR.—The theory of colors is based upon Sir Isaac Newton's observations on the decomposition of white light. Objects themselves are presumed to be void of color, but when placed in white light they absorb the rays of one or more colors, and reflect the rest; the object, therefore, appears to be, of the color that would result from the ray, or mixture of rays, which it reflects; green objects, for example, absorb the red rays, and reflect the yellow and blue; purple absorb the red rays, and reflect the red and blue. The rays so absorbed are termed *complementary* to those which are reflected; a complementary color being always that tint, which, when added to the primary color, would, upon the eye, constitute white light. The theory of color may be illustrated by placing any colored object in the light of one tint, or *homogeneous light*, as it is called, such as that of an isolated portion of the spectrum. A green object, for instance, placed in the blue rays will appear blue; if placed in the yellow rays it will appear yellow; and a white screen, which has the power of reflecting all the colors, will take any tint in succession, according to the color of the incident ray. An object of pure red, on the contrary, will appear black in any but the red ray, because it absorbs all the other colors as perfectly as charcoal or black velvet absorb white light, or rays of all colors.

S. Y.—The difference between mechanical mixture and chemical combination is very strikingly exemplified in the case of gunpowder. The materials for the manufacture of this substance are charcoal, sulphur and niter. These are separately reduced to a fine powder; they are then intimately mixed, moistened with water, and thoroughly incorporated by grinding for some hours under edge-stones; the resulting mass is subjected to intense pressure, and the cakes so obtained, after being broken up and reduced to grains, furnish the gunpowder of commerce. In this state it is a simple mixture of niter, charcoal and sulphur. Water will wash out the niter, bisulphide of carbon will absorb the sulphur, leaving the charcoal as a residuum. By evaporation the niter can be obtained, and by volatilizing the bisulphide of carbon-sulphur will remain. If we attempt to cause these materials to enter into chemical combination the phenomena are entirely changed; a spark fires the powder, a large volume of gaseous matter is produced, the charcoal disappears, and not a trace of the ingredients which composed the powder remains.

INQUISITIVE.—The term fluor spar was given to that substance, owing to its having been found to be such an excellent flux for ores; flux as well as fluor are derived from the same root, *fluo*, to flow; in fact, the last named verb possesses a similar derivation.

The World Moves!

The vignette upon the cover of the *Overland Monthly* is full of meaning. It represents a grizzly bear crossing a railroad track, and glaring savagely at the approaching locomotive. The locomotive is *suggested*,—not outlined; the designer, with exquisite taste, and genuine artist instinct, having left that for the imagination of the reader to do. The true artist as well as the true poet, knows that the pencil as well as the pen is feeble; and that if he can but *suggest*, the fancy will *paint*, in colors far more vivid than any that he can command. The cut is in admirable keeping with the style of the publication. It is perfect as it is;—to have completed the picture in detail, would have given the page a sort of school-geography look. We might, perhaps, remark that the *rails*—but we will not criticise.

The world moves! To give us this for a text,—for that matter,—the very existence, in a city of one score years, of the monthly above-named, in rivalry of its famed Atlantic counterpart, would be sufficient. But the cut aforesaid is our especial inspirer at this moment. That bear, who last week passed over this same ground for the hundredth time, the undisputed monarch of all he surveyed, now for the first time sees the *monstrum horrendum* of civilization rushing across his favorite path. We fancy that we can see, not rage only, but consternation, in his look. One glance is enough for him. He does not square himself to meet the fire-breathing thunderer. Nor yet does he send away with inglorious haste. But stepping deliberately across the rails, he "accepts the situation";—and like a sensible bear as he is, contenting himself with a second and farewell growl, seeks new and more congenial haunts.

Do we realize the position? Do we actually take home to ourselves the facts? Do we consider the difference between '49 and '69? Do those of us who came "the plains across" occasionally get "a little mixed" in our visions of remembered ox-teams,—dust-covered, toiling, sweating, crawling,—as we fancy a passenger train flashing past, and in half an hour's time disappearing beyond that land-mark which we have had in sight for days? Do we ever allow ourselves to think of that tedious journey of twenty weeks as performed in one?

On the 6th inst., the rails were laid over the continental divide between the waters of the Atlantic and the Pacific. A dispatch was sent on that occasion to parties in this city, by Messrs. Colfax, Bross and Bowles, from Benton, at the then end of the Union Pacific track, twelve hundred and forty miles west of Chicago, congratulating their California friends upon the certainty that the two oceans would be linked by rail during the coming year. On this side, the snowy Sierra having been already surmounted, the track-layers are walking along so fast that the town-builders have abandoned in despair all attempts to keep up with them. The "hotel" man would scarcely have time to arrange his little shelf of black bottles, before the "terminus" would be somewhere else,—and his "town" deserted.

The world never before witnessed such a sight as this Continent at this moment presents. Thirty thousand men, in two rival divisions,—each striving to build the greatest number of miles, and thereby to secure the greatest number of almighty dollars,—are at work. Hour by hour the track stretches itself forward into the wilderness. Antelopes run races with the locomotives. Buffaloes have been shot from the car-windows. Savages look on with amazement,—and with faces scarcely more expressive of welcome than that of the grizzly bear which we have introduced to our readers. English sportsmen "run over" across the Atlantic and into the aforesaid wilderness, "just for a lark." There they can hunt wild game, and see live Indians, while they sit at their ease with their cigars and brandy in a comfortably cushioned car. Does not the world move?

For an answer, we need not ask our grandfathers, to whom this coast was almost a *terra incognita;* we need not ask our fathers, who used to talk about "the Northwest Territory;" we need not go back even to our own school-boy days, when we read in "Two Years Before the Mast" of the hide-gathering adventures of R. H. Dana on the California coast. Our own experience here not only shows us that the world yet moves, but that it moves faster and faster as the years roll on. The "Pony Express" was a grand institution in '60. In '61,—eclipsed by the greater glory of the telegraph,—it was forgotten. Even so will the three-week's *journey* to New York by steamer, which took the place of the six-months' *voyage* "around the Horn," soon give place, in its turn, to the seven-days' *trip* by rail. The irrepressible Yankee is always in a hurry; and whatever the rest of the world may do, *he* must move!

INTEREST CONCERNING MINING AND GEOLOGY IN CHINA.—The first thing that the Chinese have demanded from our more tangibly advanced civilization, is the benefit of our acquaintance with mining and geology. When we go back to the darkest ages, we always find that the nations which pursued mining and the working up of metals, were the most powerful, and took the lead of the world. Agriculture followed it up with the comfortable and steady gait of an ox. But the powerful nations dug their strength out of the bowels of mother earth; for, without the metals, it is evident that we would be mere Indians. By trading, other nations not so noted for the production of metals, were enabled to participate in the greatness of their neighbors, but they had necessarily to pay their tribute, and they always stood second. Now, there is no surer index of the intelligence and civilization of the Chinese than this same desire for our assistance in the matter of geology and mining. Pumpelly was engaged by the Chinese Government a few years ago, and McGowan follows in his footsteps. Prof. Blake did similar service for the Japanese, the results of which we would like to have seen given to the public. We can teach our Mongolian *vis-a-vis* everything in that branch of human advancement. It remains to be seen whether we shall not desire similar benefits from the Oriental civilization, as developing in these times another phase of the destinies of history.

PARTIAL DESTRUCTION OF HILL'S SMELTING WORKS.—The new smelting works erected by Prof. Hill at Central City, Colorado, last summer, for the treatment of the refractory ores of that district by the ancient and sure method of submitting them to the manipulation of fire, were nearly destroyed by the same element getting the better of them while the workmen were skimming a charge preparatory to drawing it, in consequence of some sparks rising from the furnace to the unprotected roof. Fortunately the building containing all the valuable machinery was saved, but everything else in the neighborhood was reduced to ashes, except the furnaces and chimneys. Prof. Hill has a Prussian and a Swansea man employed as experts, and the success of his and other similar enterprises will prove of great importance to the permanent development of mining in Colorado.

LEAD AND SMELTING PRODUCTS.—Selby exhibits a great variety of shot and lead pipes, and some smelting products. There are eight different stages of mechanical preparation of the galena represented, principally the results of jigging and buddling; and there is some slag from the furnace; an antomonial lead, product containing silver; and some antimonial oxide derived from the last mentioned, by oxidation of the metallic antimony which was associated with the lead.

Raw Products.

Employments which produce the raw materials of industry—the productive trades—are rural in their character and associations, as they depend on the fertility of the soil, productions of vegetable and animal substances of utility, and the contents of veins and strata. A knowledge of these raw products should be the first consideration in the business of every thinking and reading mechanic, as it is the most essential prerequisite and important attainment for every master manufacturer, whose pursuit consists in working them up or modifying them in such a manner as to supply the wants of society. It is demonstration of the existence of such wants that establishes trades and manufactures. The raw materials are to be found in particular localities, generally in great abundance. Their adaptation brings honors, power and wealth to the thinking adventurer and observer, who, having become familiarized with natures' stores, possesses the practical sense to devise a tangible method of supplying the article exactly where it is wanted. He pays nothing for it; it lies outdoors as the constantly offered premium for intelligence and originality of enterprise; and the capitalist is ever standing ready to pay the necessary expenses provided only that there is evidence to his mind of the presence of the element of practicability—the business world's great desideratum. The adapter then becomes a benefactor. While he acquires a competency, relieving himself from care, and returning to buoyancy of disposition and cheerfulness of countenance—he will not think himself above better people, unless he be morally a fool, and ripe for the correction which pertains inevitably to that situation—the benefit of the products he has presented to the world reduces general inconvenience, and relieves thousands of what, if it were summed up, would be a mountain of care. Such is the constant object, simplified, of all industry and invention. Our field at the gate of the Pacific is not only new and rich in the rewards it holds out, but gold and silver have been scattered over hill and valley, that we may not fail to stumble upon the resources whose development is plainly destined to effect a giant stride for the advancement and extension of our race and civilization.

PROGRESS OF DEVELOPMENT.—In twenty years, the race whose motto is "Westward ho!" has opened up a larger area of territory than has ever before been brought within the range of civilization in anything like the same space of time. Furs and gold have brought us hither. Where agriculture cannot take root, the barren area will be developed by the utilization of a variety of natural products which are known to exist, and which are applicable in large quantities to chemical manufacturing, demanding only cheapness of transportation. Humboldt says: "Wherever metallic veins have been discovered, in the most uncultivated parts of the Cordilleras, on the isolated and desert table-lands, the working of mines, far from impeding the cultivation of the soil, as it is generally imagined, has been singularly favorable to it." Our watered valleys in the sage brush States and Territories will very speedily be garden spots, connected by railroads with important districts which are establishing themselves as great centers for the production of substances which commerce demands from inorganic nature.

THE ANTHRO-PHOTOSCOPE is an optical invention by Rowell and Mills, exhibited up stairs in one of the towers. It gives the effect of the stereoscope from a single picture, associating any given figures with such landscapes as may be selected; and the principles made use of are, the angle of the ordinary line of sight with the level of the ground on which the spectator stands, producing the natural effect we see in objects, the further appearing above the nearer; and the optical association of the figures with other objects in the landscape.

DETERMINATION OF MINERALS AND CHEMICAL SUBSTANCES. A system of instruction in the practical use of the blowpipe, being a graduated course of analysis. By G. W. Plympton, Professor of Physical Science at Brooklyn Polytechnic Institute. Illustrated; 12mo., cloth.

A knowledge of blowpiping is a thing so easily acquired, and of such general application and never-ending satisfaction and amusement to all who are mentally constituted with a desire for simplicity, and for resolving what appears complicated into a few and unmistakable elements, that an acquaintance with its beauties and conveniences cannot be too eloquently advocated. It is one of the nicest and best little inventions that has ever been brought to practical perfection and general application; and, now that we have a good and comprehensive practical book in English, embracing all that can be necessary for those who do not intend to make blowpiping a speciality—a book that will enable any studious miner to analyze the world into its separate chemical elements, as easily as he can separate the sulphurets from the tailings—let those who love to bring their own intelligence to bear in a country so universally interested in mining and metallurgy as California, inform themselves at least of what blowpiping is; and the next step will probably be to buy the book, order a blowpipe, and the few necessary reagents, which are by no means expensive, together with a little cabinet of test minerals and substances for practice. Somebody can be found within reach everywhere, to convey to the inquirer an idea of the simple methods of procedure, whilst residents at the Bay, or in any of the mining centers, will not find any difficulty in procuring a more complete and thorough instruction.

The blowpipe is a universal instrument. With its dozen or so usually accompanying reagents, wet and dry, it embraces all of qualitative chemistry; and it is far more satisfactory and true to the processes of nature, than the ordinary qualitative chemistry in the wet way, as taught, because one can reproduce, by its means, almost every act of Nature itself, to illustrate the formation of natural compounds; as well as separate the elements, and undo the mysterious combination. It places within reach, in one's own chamber, the poetry of alchemy. Become acquainted with the simple metallic and non-metallic substances, and then with their oxides—which are produced by their affinity for and marrying with the virile element of the air, oxygen—and you are at once in possession of the key to the situation. The blowpipe enables us to oxidize, or to reduce by taking away the oxygen, and restoring the metal to its native state, at pleasure; the light blue outer flame oxidizing the yellow flame reducing. We can do everything with it, whilst amusing ourselves for half an hour, which it is possible to do in smelting and assaying. With such instrumentalities at hand, it is stupid on the part of millowners, and culpable on the part of those who claim to be practical experts, to remain ignorant of their application.

The book in question is well arranged as to the order and sequence of the manipulations described, clear and distinct in its manner of putting things, and it contains all the valuable tables which have been compiled from Berzelius down, for reference in the determination of minerals. To those already familiar with the use of the blowpipe, many points of interest will be found in the appendix, containing some of the later contributions to the science by Prof. Chapman and others. For sale by A. Roman & Co.

THE MECHANICS' TOOL BOOK, with Practical Rules and Suggestions for the use of Mechanics, Iron Workers and others. By W. B. Harrison, Associate Editor of the *American Artisan*. Illustrated with 44 engravings, 12 mo, cloth.

This is a very useful and practical book for mechanics, the object of which is to teach the proper use of tools, and also to learn the young mechanic how to provide himself with many useful devices, for simplifying and expediting his work. Close observers will notice a great difference among mechanics in the manner in which they handle tools for doing the same work. An awkward manner in the use of tools, not only makes bad but slow work as well. In any shop, and especially in a jobbing machine shop, the value of man's services often depends largely upon his readiness in adapting himself and the tools to the work before him. The object of this work is to assist the mechanic by suitable hints and instructions to most readily meet all these contingencies. Some seventy different kinds of tools are introduced with many novel modes of applying them. The text is also profusely filled with illustrations. The work contains many facts and suggestions, which may be common place, but all are useful, and the book should be in the hands of every mechanic. For sale by A. Roman & Co., 417 Montgomery street.

(Written for the Mining and Scientific Press.)

The Age of Gold-Bearing Rocks.

BY PROFESSON ROWLANDSON.

(Continued from page 82 of last issue.)

Want of space compelled me to defer noticing instances, in which it is probable that both the volume and value of auriferous rocks existing in strata of the silurian age, would be found greater than if situated in secondary or later formations. Preliminarily, however, I may remark that in the course of the remarks which will follow, it is assumed as a well established fact that all auriferous veins deserving that title, have their origin in plutonic action,* emanating from the nether regions of the earth. If this fact is conceded, and the geological reasons that can be adduced in its favor are more than 100,000 to 1, as compared to what may be stated against such a theory, it must be perfectly evident to the merest tyro in stratagraphy as now well settled by the aids afforded by paleontological evidence, that in all cases where auriferous matter has to be projected or sublimed by igneous agency through paleozoic strata, before it can reach secondary ones and become condensed or fixed in the latter, that the probabilities are great indeed in favor of the view that in such cases the auriferous veins existing in the lower and older rocks should not only be more expansive, but that such veins would also be more thoroughly impregnated with this noble metal. The question, however, arises, does such a case occur, or does it not happen that in those instances, as in California, where some of the most productive gold quartz and pyritous veins, known to history, ancient or modern, are now being extensively worked amongst rocks of secondary age, (cretaceous) that the whole, or nearly so, of the sub-lying paleozoic rocks has, by the same igneous agency, from which has originated the auriferous emanations, been converted into granite, eyenite, diorite, hornblende and cognate igneous rocks? In such a case the so metamorphosed paleozoic rocks would necessarily become the exciting cause and direct medium of producing auriferous veins in the more recently formed and overlying secondary strata; but such an effect could not be brought about but by the entire destruction of the physical properties of such paleozoic rocks as sedimentary ones.

I am aware that Baron Richthofen has written a very elaborate paper relating to the metamorphism of rocks under circumstances analogous to those just suggested, in which Baron Richthofen rather strongly asserts, but as the writer believes on inefficient grounds, that the metamorphism of the older rocks in the manner above indicated, does not take place; this, however, is a debatable point, which a few years discussion will probably set at rest, as well as many others incident to this subject.

The additional space required at the present time on account of the Mechanics' Industrial Exhibition, by the MINING AND SCIENTIFIC PRESS, obliges me to curtail many observations in reference to this subject, some of which, associated with the question of the aqueous or igneous origin of certain metallic minerals, I shall defer to another week.

*Some day I purpose discussing this part of the subject, as well as the origin of metallic ores generally.

CAPTAIN HUTTON, who has been making a survey of Lower Waikato district, on the north island of New Zealand, reports that there is no prospect of alluvial gold there, but that tertiary coal exists, which is similar to cannel coal, in a bed containing 140,000,000 tons, and which can be worked without pumping.

TO NORTH OF US.—The people of Vancouver Island and British Columbia have been rather in a dispirited mood, on account of the slowness of the development of their really attractive shores, and have only taken heart at the increased production of gold from Cariboo during the present season. Many wide-awake Britons have come to San Francisco and gone into business here, and a great many more talk about getting out of the country. Lumbering and coal mining, however, are tolerably prosperous. Great efforts have been made to impress upon the home government the importance of building a transcontinental railroad from Canada; but there is really no hope that it will ever be done until a very largely increased population, and forty or fifty years more of development shall demand it.

SMELTING ARGENTIFEROUS GALENA.—Cottonwood Cañon is about 27 miles southeast from Salt Lake City, in the Wasatch mountains. It contains several mines. A Mr. Hirst is running two furnaces there at present, not on an extensive scale, but the results are satisfactory. Hirst thinks his ore will yield $200 to the ton. He has a German to manage his works who is reputed to be skillful. The veins occur in limestone, and ore exists at the surface in abundance. This is a valuable lead-mining district. The ore is remarkably free from antimony.

WANTED—At this office, the postoffice address of Enraght Massey, late of Gold Hill, Nevada.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-aim

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Paint will not remove in five minutes. Whether a frightful Burn, a griping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers, or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.

G. H. MOORE, Inventor and Sole Proprietor, 652 Market street, San Francisco, Cal. 21v16-3m

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

☞TO THE PUBLIC.☜

Hear what Bussey has got to say in defence of his Lock:

WHEREAS, Certain parties in San Francisco and elsewhere, are conniving to destroy the reputation of the Bussey Lock, in order to establish other Locks in which they are interested; and

WHEREAS, It is asserted that a certain individual now in this city will put up $5,000 against the same amount, that he can pick the Bussey Lock in eight hours' time; but makes Bussey this generous proposition: That he does not wish to injure him in any way, and if he will pay a certain amount of money the Lock will not be exposed. Wants Money, is in the market at the highest bidder!

Now Bussey wishes it distinctly understood that he pays no man to keep quiet. Bussey's Improved Combination Lock will be on exhibition at the Mechanics' Fair, in competition with other Locks for the First Premium, and a challenge will be given then and there, to the world in general, and H. S. Folger in particular. The security of the Lock will be endorsed in any amount, from $500 to $50,000. The man presuming to pick it will be required to endorse his skill in a corresponding amount.

California Pioneer Fuse
MANUFACTURING COMPANY,
MANUFACTURERS OF
HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Pacific Iron Works.
First and Fremont Streets,
SAN FRANCISCO.
Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.
Among other things, we manufacture the following:
STEAM ENGINES,
Horizontal and Vertical, for either Stationary or Marine use.
BOILERS—High and Low Pressure,
Pump, Pipe and Sheet Iron Work of every kind.
Quartz Mill Work,
Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.
Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.
Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel-saving, first-class Engine, this is, without doubt, the best Engine made in the United States.
Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner.*

[From the Mechanics' Fair Daily Press.]

WHAT IS WANTING.—As new articles are still floating in at the rate of a hundred entries a day, not counting those that are lugged in without asking the entry clerks to record them at all, it is not easy to judge, at the present time, of the nature and extent of the blanks which may be found in the representation; though it is believed that there will be nothing essential wanting. Criticisms will of course be made as to what might have been, or ought to have been different, or better, but we may rest content, and pleased, with things as they are. A better show might have been made, for example, in the Art Gallery, if some of the fine productions particularly characteristic of the coast and times, in the possession of private individuals, had been brought out instead of some uninteresting square rods of photographs; but as there is still room left on the walls, it is to be hoped that the public will be gratified with something additional in that most interesting and effective branch of instruction at the Fair. Ores, too, are thus far observed to be slighly represented; but we can better dispense with them in the presence of Mr. Kustel's fine collection of minerals, which is scientifically arranged, and embraces in perfection every ore that is found on this coast, or anywhere else. Specimens interesting on account of their splendor, richness or uniqueness, would add greatly to the attractions of the mining and geological department in the eyes of the mass of visitors.

THE EXHIBITORS.—Somebody has remarked that the Exhibition is a big advertising concern. The man was a cynic, and yet he very aptly told one side of the truth. Such advertising is legitimate, and it is most creditable to the wide awake business men, who goes to great expense, and volunteers a month of trouble and care for the amusement and instruction of the public in his specialty, in order that they may know what advantages can be derived from availment of that which he offers. It is all open and above board; the exhibitor is not afraid of comparison with all the world beside. That is sufficient evidence in the first place that there is no humbug in his dealing. He meets you on the broader basis of the good of the community, and he has bet the amount of his expense and trouble that he will be able to prove to you that he can benefit you more than you can ever benefit him in purchasing of him, by just the difference between his little profits and the price you pay. He is ready to become acquainted with you, and to interest you in the details of the branch which he fully understands. A thousand able instructors,—better than professors, because they understand thoroughly without professing much of anything,—are standing in readiness at the Exhibition, with agreeable address and command of language, to teach you in an attractive manner, by personal lecture, the ancient classic conversational method of instruction, almost everything that can be of interest to you. Three dollars is a small price to put you through our University—it is only to pay for the roof. Read the FAIR PRESS, and introduce yourself to our amiable professors. The only danger is that you will not devote enough time to the matter.

SOMETHING NEW.—Messrs. Swyney and Smith, engineers and draughtsmen, have made a novel and lively addition to the fountain, suggested by observing that a current of air is produced by the falling of the water therein. The idea has been developed into what may become a useful invention, to be styled the Aquatic Wind Mill, which it is thought may be made valuable for drainage, irrigation, and other purposes. The services of the MINING AND SCIENTIFIC PRESS PATENT AGENCY have been secured to obtain a patent for the same.

WHAT, AND WHEN.—If you want to study things, go to the Exhibition in the morning, when you will find all the exhibitors at leisure and in a mood to do business. If you wish at the same time to meet everybody in the exhibiting and business line, go in the afternoon. To study human nature you must go in the evening. Seat yourself near the fountain.

STATE AGRICULTURAL FAIR AT SACRAMENTO.—The Fifteenth Annual Fair of the tate Agricultural Society will be opened a the 15th of next month—in four weeks om this—or about the time of the conlusion of the Mechanics' Institute Fair. iberal premiums are offered for live stock, achinery, implements, textile fabrics, ill and domestic products, agricultural roducts, fruits, and fine arts. Preparaons are already under way by the enterrising people at Sacramento.

Office 619 Montgomery Street.
Cyanide of Potassium.

Messrs. Falkenau & Hanks—Gentlemen:—I have, in the st year's experience in milling gold ores, had occasion to examine, with care, the effects of the Cyanide of Potasum in promoting amalgamation. I am bound to say, as e result of my observations and experience, that it is a ost powerful agent in amalgamation. With its aid and id of a little sodium and amalgam, copper plates are imediately mercurialized with ease and certainty, and the ects of nitric acid entirely avoided. The solvent power Cyanide of Potassium on metallic oxides is well known chemists, and its effects in brightening the dull surface unhealthy coppers in mill sluices is something wonderful witnessed. Gallons are divided among amalgamators as the durability of this effect, as compared with the ordiry mode of treatment by the brush, etc; but my own dg- ent points clearly to the remarkable power as being subject well worthy of the careful and candid examinaon of all who have an interest in the management of gold artz mines. Of its efficiency and usefulness in pan rkings no one, I believe, entertains a doubt.
Yours truly, PROF. B. SILLIMAN.
Manufactured by FALKENAU & HANKS. Office No. 9 Montgomery street, San Francisco.

SPECIALTIES.
PRICE AND GUARANTEE.
The largest and most varied stock of Gentlemen's Clothing, Furnishing Goods, Trunks, Bags and Valises, on the Pacific Coast. Every article sold, being of our own manufacture, is guaranteed. Having contracts direct with European and American manufacturers of place goods, we thereby effect a saving of fully 50 per cent. in wholesale dealers' profits, and are thus able to offer superior goods at less than second-rate prices.

STYLES.
Having agents in London and Paris, we introduce the new styles in San Francisco simultaneously with their appearance in New York.

GOODS MADE TO ORDER.
For the accommodation of such as may desire, we have secured the services of a celebrated European cutter, and are prepared to make up piece goods in a style superior to any other house on the coast. Shirts, Ties, Collars, etc., made to order at short notice.

COUNTRY ORDERS.
Goods forwarded by Express to any part of the Pacific Coast on receipt of orders and measures; send for directions for measurement.

Subscribe for the New Volume of the Mining and Scientific Press.

The proprietors of this journal will undertake to make the Seventeenth Volume of the MINING AND SCIENTIFIC PRESS (commencing July 1st 1868), superior in many respects to former issues.

It will be printed on extra quality of paper, rendering it a handsome volume to file for future use.

An increased amount of editorial labor will be expended in the preparation of leading articles relating to the progress of scientific developments in various parts of the world; new discoveries in geology, mineralogy, metallurgy, and new processes and methods relating to mining in all its branches.

Illustrations will be given of apparatus for saving precious metals, and of machinery and inventions of general interest.

Each number will treat carefully on subjects of home trades, manufactures and domestic economy

Our mining summary and weekly stock report gives the latest news from the most important mines and mining districts throughout the Pacific States and Territories.

An official list of patent claims issued to inventors on the Pacific Coast, is published in advance of all other journals.

The latest prices of stocks are quoted; also the produce and market rates, metal market and prices of copper ores.

Our "Mining Shareholders' Directory" advises holders of meetings, assessments, dividends, sales, etc.

"Answers to Correspondents" afford much of interest to readers and of advantage to the community.

The Mechanical and Scientific Miscellany contained on a single page of each issue we are frequently told is worth the price of the whole paper.

Information contained in one article has been known to benefit a single subscriber an hundred fold the cost of a year's subscription.

The PRESS was established in 1860, and as a mining and mechanical journal has met with unrivalled success.

Sample copies sent free on application.

Subscription, $5 per annum.

DEWEY & CO.,
Publishers, Patent Agents and Job Printers, corner Sansome and Clay streets, San Francisco.

PLAN OF THE EXHIBITION. — As the visitor enters the door he will find on his right hand, machinery and hardware in general, and on his left textile fabrics and lighter manufactures. The front wings are occupied by musical instruments, drawings and liquors (esthetics!) on the right hand, and by a restaurant on the left. The long traverse wing at the rear, opposite the entrance, is devoted to art. In the galleries are wines, confectionery, bookbinders productions, etc. The steam plow is stabled outside.

THE FOUNTAIN.—The spray at the Pavilion fountain rises to the roof, nearly the same hight as the level from the hill side from whence the water is drawn. If the pipes leading down to the spot were interstices between layers of rock, it would be called an artesian well. In the oil wells, however, there is a gas which forms spontaneously, fills up all the spaces, and then presses up the fluid, sometimes to an enormous hight.

THE BONNET.—Shakespeare must have had a vision of the modern bonnet when, in the "Taming of the Shrew," he wrote the following:—

Petruchio—"Why, this was molded on a porringer,
A velvet dish;—fie, fie!—
Why, 'tis a cockle for a walnut shell,
A knack, a toy, a trick, a baby's cap;
Away with it! come let me have a bigger!"
Katharine—"I'll have no bigger; this doth fit the time;
And gentlewoman wear such caps as these."

Novelty and Usefulness Combined.
Wilson's Prepared Solder
Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

THE LATEST IMPROVEMENT
In Dentistry.

PATENTED DECEMBER 3d, 1867, by DR. G. W. COOL. The right of San Francisco reserved for his own use. The nature of his improvement consists in lining the entire concave surface with fine gold; it makes the plate twice as strong and one-third thinner than the common vulcanite plate. This work has given satisfaction in every case. Please call at No. 14 Third street, near Market, and see specimens. All work warranted as fine as the specimens. Prices reasonable. 21v16-3m

A TREATISE
—ON—
CONCENTRATION
OF ALL KINDS OF ORES;
INCLUDING THE
CHLORINATION PROCESS
for Gold-Bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally.

BY GUIDO KUSTEL,
Mining Engineer and Metallurgist, Author of "Nevada and California Processes of Silver and Gold Extraction."

With 120 Diagrams on 7 Plates.

CONTENTS:

I.—INTRODUCTION.

1. *The Dressing.*—Dressing of Ores; Principles of Dressing; Division of Dressing.
2. *The Separation.*—Separation of Gangue from Ore in the Mine; Dressing of Ores outside the Mine; Separation by Hammers; The Ragging; The Spalling; The Cobbing; Separation by Hand; The Picking.
3. *Cleansing and Sizing Contrivances.*—Washing and Sizing; Stationary Apparatus; The Sluice; The Kiln; The Step Sluice; Movable Machines; The Hand Riddle; The Rocker; The Circular Hand Riddle; Swinging and Jarring Riddles; The Jarring Riddle.
4. *Rotary Sizers.*—The Trommel or Drum; Cylindric Trommel; Prismatic Trommel; Conical Trommel; Combined Trommel; The Sifting Wheel; Sizes of Grains for Jigging.

II.—REDUCTION.

1. *Reduction of Ores.*—Reduction of Ores to a Proper Size; Breaking under Heavy Stamps; Reduction by Rock Breakers; Hanscom's Crusher; Blake's Quartz Breaker; Reduction by Stamps.
2. *Description of Batteries.*—The Foundation; Mortar Blocks; Frames; Iron Frames; Howland's Rotary Battery; The Straight Iron Battery; Bryant's Battery; Wright's Iron Battery.
3. *Details of a Battery.*—The Mortar; Stem or Lifter; Shoe or Pestle; Socket or Head; Tappet; California Tappet; Cams—Wooden Cams; Iron Cams.
4. *Speed, Curve and Order of Lifts.*—Limit of Speed in Crushing; Construction of the Cam Curve; Order of Successive Stamp Lifts; Hanging-up of Stamps.
5. *The Discharge of Batteries.*—The Discharge in Dry Crushing—with Grates; without Grates; with Sieves; Dust Chambers; The Discharge in Wet Crushing—the Grates and Screens.
6. *Feeding of Batteries.*—Hand-Feeding; Stationary Hoppers; Movable Hoppers; Quantity of Water for Crushing; Remarks on Speed and Weight of Stamps.
7. *Reduction by Rolling Mills.*—Construction of Rollers; The Frame; Feeding of Rollers; Remarks.
8. *Grinding.*—The Arastra or Tehama; The Edge or Chili Mill; Ball Mills; Lundgren's Pulverizer; Cylinder Mills; Ferrand Mill; Hopkins' Grinder; Horizontal Mills; Iron Pan Grinders.
9. *Pans with Plane Mullers.*—The Common Pan Grinders; Tub Grinder; Bartolo's Grinder; Knox's Pan; Varnoy's Pan; Wheeler's Pan; Union Grinder; Moore's Quartz Grinder; Gashn's Grinder.
10. *Pans with Conical Mullers.*—Hepburn & Peterson's Pan; Belden's Pan; Baux & Guiod's Grinder.
11. *Pans with Tractory-Conical Mullers.*—Excelsior Pan; Wheeler & Randall's Pan; Excelsior Continuous Grinders.
12. *Pans with Perpendicular Mullers.*—The Confugal Ore Grinder; Varney's Quartz Grinder.

III.—CONCENTRATION.

Concentration of Reduced Ore.—Division.
A. *Concentration of Ore Grains, (Jigging Stuff.)*
Jigging Principle; The Jigging.
2. *Movable Jiggers.*—The Movable Jigger.
3.—*Stationary Jiggers.*—Hydraulic Jigger; Pethick's Separator; Stationary Jigger.
4.—*Continual Jiggers.*—Percussion Jigger (Setzerd); Continual Cylinder Jigger; Continual Jigger; Hydraulic Continual.
5. *Rotary Machines.*—The Rotating Cylinder (Strom-setz Maschine); Rotating Wheel (Setzrad); The Dolly Tub; Auferman's Dry Jigger.
B. *Concentration of Ore Sands and Slimes*
6. *Assorting of Sands.*—The Labyrinth; Borcze's Slime Separator; Ph. Hofmann's Separator; Rittinger's Funnel or Pointed Box; Rittinger's Spitz-Lutto.
7. *Feeding of Concentrator.*—Feeding Boxes; Stationary Feed-Box; Rotating Feeder.
8. *Stationary Concentrators.*—Hand Buddle; Sleeping Table; Rack; Sweeping Tables; Round Buddle; Concavo Buddle; Blanket Tables.
9. *Percussion Tables.*—Percussion Tables; German Percussion Table; Continual Percussion Table; Hunter's Continual Percussion Table; Varley's Percussion Buddle.
10. *Oscillating and Shaking Tables.*—Borlace's Concentrator; Hendy's Concentrator; Hungerford's Concentrator; Barron's Concentrator.
11. *Steady Moving Concentrators.*—Steady Moving Concentrators; Concave Rotary Buddle; Convex Rotary Buddle; Burton's Table; Self-Discharging Blankets; Horizontal Moving Blanket.

IV.—SPECIAL CONCENTRATION.

1. *Concentration of Gold Ores.*—Concentration of Gold Ores; Amalgam of Gold Quartz; Amalgamation and Grinding; Combined Concentration and Amalgamation; Treatment of Concentrated Stuff.
2. *Concentration of Silver Ores.*—Concentration of Silver Ores; Concentration Works; Cost of Concentration; Concentration of Tailings.
3. *Concentration of Lead and other Ores.*—Concentration of Lead, Copper and other Ores; Value of Ores for Concentration.

V.—CHLORINATION.

Extraction of Gold from Sulphurets or Arseniuals by Chlorination; Assay of Gold Sulphurets by Chlorination; Chlorination Process for Sulphurets; Loss of Gold in Roasting; Single Roasting Furnaces; Double Furnaces; Mechanical Furnaces; The Roasting Operation; Roasting with Salt.

Chlorination.—Dumping of the Roasted Ore; Sifting; Production of Chlorine Gas; Lixiviation; The Precipitating Vat; The Precipitation; Cost of the Chlorination Process per ton of Ore; Remarks.

Other Methods of Dissolving and Precipitating the Gold from Sulphurets.—Chlorination at Reichenstein; Chlorination at Schemnitz; Calvert's Method for Auriferous Quartz; Extraction of Gold, Silver and Copper.

PRICE ..... $7.50 per copy.

Sent by mail, and sold wholesale and retail, by DEWEY & CO., publishers, office MINING AND SCIENTIFIC PRESS, San Francisco.

MINING PRESS.—This old standard mining journal of the Pacific Coast, comes to us this week, number 1 of Volume XVII, and much improved in several particulars. A beautiful new head and heading letters throughout, make it the neatest, as it has always been the best, exponent of the industries of this coast. Every miner should take the PRESS. The subscription price is $5 per year, and the Postmaster at Monitor is an authorized agent.—*Alpine Miner July 4th.*

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

And in accordance with law, and an order of the Board of Trustees, made on the twentieth day of May, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the sales room of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on the sixteenth day of July, 1868, at the hour of 11 o'clock A. M. of said day, for cash, in U. S. gold coin, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

PAUL NEUMANN, Secretary.
Office, No. 411 California street. jy4

POSTPONEMENT.—The above sale is hereby postponed until Friday, the thirty-first day of July, 1868, at the same hour and place. By order of the Board of Trustees.

PAUL NEUMANN, Secretary.
San Francisco, July 14, 1868 jy18

POSTPONEMENT.—The above sale is horoby postponed until Monday, the seventeenth day of August, 1868, at the same hour and place. By order of the Board of Trustees.

PAUL NEUMANN, Secretary.
San Francisco, July 31, 1868. aut

Bear River Mining Company, Nevada County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the tenth day of June, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. shares.	Amount.
A G Pier	1	50	$50 00
Wesley Henderson	2	50	50 00
W J Stringer	3	50	50 00
H McCormick	not issued	662	662 00
C Jones	not issued	662	662 00

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of June, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, on the seventeenth day of August, 1868, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.
Office, Room 37 Now Merchants' Exchange, California street, San Francisco. au1

Office of the Folsom Street and Fort Point Railroad and Tunnel Company, southwest corner of Montgomery and California streets, Room No. 16, San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of July, 1868, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to Caleb T. Fay, Esq., at the office of the Company.

Any shares of stock upon which said assessment shall remain unpaid on the twenty-ninth day of August, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourteenth day of September, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Machinery.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. O. GULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

Brodie's Patented Improvements

[FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... **$600**

No. 2—Or 15-inch Crusher, capable of similarly pulting through five to six tons per hour..... **850**

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... **1,200**

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

19v16-3m H. C. BENNETT, Secretary.

[From the Mechanics' Fair Daily Press.]

All to the Fair.

There is every reason to believe, from the auspicious opening, that the Fair will be a more complete and imposing exposition of the industry of the Pacific Coast, than has ever before been witnessed; for which reason the farmers and mechanics, and all others from every section of the Pacific Slope, should make it a point to be present. It will be to them better than a Paris Exposition, for it will be a representative of their own industry, presented almost at their very doors; and one to which they can bring their wives, their sons and their little ones, at but a trifle more than an ordinary holiday's expense. The collections they will see will inspire their industry and stimulate their zeal for years to come. The various departments of the Exhibition are replete with every legitimate object of attraction. The finest specimens of field produce, as well as of the garden and dairy, with the latest and most approved machinery for producing the same, will interest and instruct the farmer. The mechanic and artisan will find almost every class of machinery and every species of manufacture; while the lover of the fine arts can spend days and weeks, if he chooses, in gazing upon and contemplating works of real merit, in every department of that elegant branch of human industry and genius.

A man's own eyes are his best educators; there is nothing like bringing together the farms, the workshops and the art galleries of a people into one common center, where each can study and observe what progress the other has made. He must be a stupid dunce who fails to profit by such an exhibition; and the mechanic or artisan who neglects to put his handiwork in competition with his neighbor's, either from lack of energy or fear of the test, should be avoided as one certainly not up with the times, and unworthy of public patronage.

For the time being, this Exposition is the great industrial school of the Pacific Coast, the representative embodiment of the skill, energy and enterprise of our people. Let our friends, both in the city and interior, devote a good week to its examination and study. Depend upon it, you will profit in health and purse, and it will tell upon your work and plans for the ensuing year. Be up and alive to the progress of the age. The time to prosper by mere work, without intelligence, has gone by. The best source of intelligence is art teaching—a personal comparison of ideas and systems; a careful view of methods and results of distant, yet related employments. Routine cannot even hold its own—it degenerates, loses interest, becomes effete. California is no place for such a condition of things—such a class of people. Our people are a live people; they encourage home industry; they study to excel in all things that are good and profitable. They raise the finest wheat, the largest and best vegetables, the most delicious fruits; they make the best and most improved machinery for the purpose in view; they believe in competition; encourage and patronize fairs of every description. In short, they are up and alive, a little ahead of the times, and enjoy the greatest degree of genuine prosperity of any people on the earth.

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Ships, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

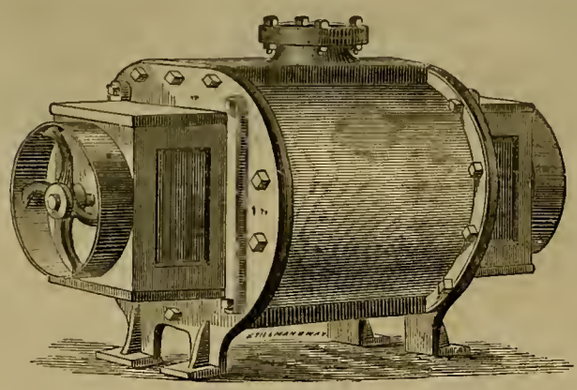
☞ This Detector is covered by two U. S patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address

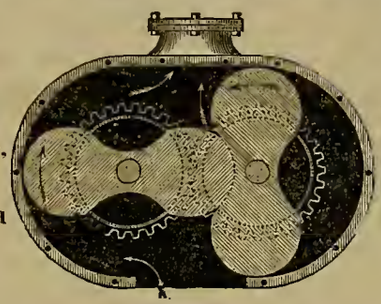
J. E. BUERK, Proprietor,

47 Congress street, Boston.



☞P. O. Box, No. 1057. 23v16-6m

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Fraacisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

Anatomical Boots

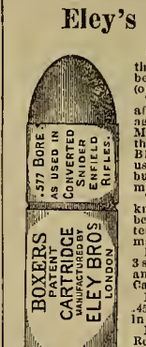
AT TEN DOLLARS PER PAIR.

Having received lately from Washington a patent for his new invention in Lasts, he is now prepared to make and sell as good Boots as the world can produce, at the above named price. A liberal discount will be given to the trade.

J. H. SWAIN,

206 Bush street, San Francisco.

TO SPORTSMEN.



THE UNDERSIGNED, HAVING BEEN APPOINTED Sole Agent for the Pacific Coast for the sale of ROPER'S BREECH-LOADING SHOT GUN, which discharges four shots in two seconds, circulars will be furnished by applying to or addressing

HENRY EITEL,

111 Second street.

Or Lock Box 1172 P. O., San Francisco. 18v15-21m6m

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES, .450 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolvers of 12 M, 9 M. and 7 M, bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16tm

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL, are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

What can be seen at Woodwards? Almost everything in nature. It is a little world in itself, with fountains, brooks and lakes, with green and grassy lawns, with every variety of bird and beast, plants and fruit, statnes and pictures, eggs, shells and minerals. What cannot be found at Woodwards Gardens? *

Removal.—Our friends will please bear in mind that the Mining and Scientifio Press Office, Patent Agency and Job Printing Office has been removed from 505 to 414 Clay street, about half a block below Sansome.

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

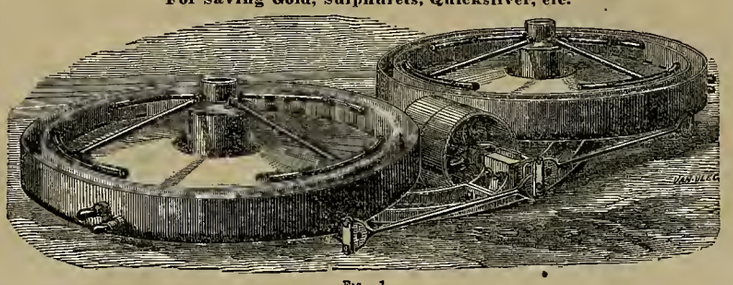

Fig. 1.

There is no description of machinery of so mueh importanee to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Huagerford & Prator Coneentrator, with whieh his name is already so familiar.

Fig. 1 is a perspective view of that pan as now eonstrueted. For economy of space and machinery, one shaft is made to drive two pans, which are set and arranged as shown in the eagraving.

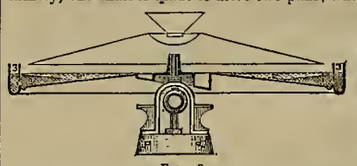

Fig. 2.

Fig 2 is a section through the center of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a eirculur trough outside the periphery.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

It should be borne in miad that Mr. Hungerford is the original builder and maker of the eelebrated Prater Concentrator, und his name should be sufficient guarantee to warrant the puhlic in examining his new maehine hefore purehasing elsowhero.

RECOMMENDATIONS:

Newcastle, Cal., June 21, 1868.

M. Hungerford, Esq.—*Dear Sir:*—Having used oight of your improved Concentrators (built by Goss & Lambard, of Sacramento), it affords me pleasure to bear testimony to their efficiency und adaptation to the purposes for which they are designed. I have used various styles of Concentrutors during the last five years, but have found nothing that begins to compare with your machine, for durability and thorough concentration; and I ean confidently reeommend them to millmen, heing, in my opinion, the best Coaecentrator now in use. Yours truly,

J. C. Corey.

Newcastle, Placer Couaty, Cal., June 23, 1868.

Mr. Morgan Hungerford, Esq.—*Dear Sir:*—After witnessing tho operation of eight of your Coneentrators for a month, in the Golden Rulo mill, Placer County, and running the same number in the Mt. Pleasant mill, El Dorado County, I am satisfied they are superior, as Concentrators, and more durablo and less liuble to get out of order, than any Concentraters I havo seen; and I recommend them to millmen, feeling assured they will, after tho most thorough trial, he pleased with them.

Very respectfully, L. E. Atchison, Metallurgist.

Big Oak Flat, May 23, 1868.—*Mr. Thos. Mulford*—Dear Sir:—I have used two of Mr. Hungerford's Concentrators in tho Rattlesnako Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. Smith, Supt.

These Pans can be seen at the Pioneer Mills, entrance on Stephenson street, San Francisco.

In future these Pans will be manufactured exclusively by GOSS & LAMBARD, of Saeramento, which is a guarantee that they will be built in the most substantial manner. Price, $300

Address, Goss & Lambard, Sacramento, or M. HUNGERFORD, San Francisco.

AMERICAN
(WALTHAM)
WATCHES,
THE BEST:
THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, tho most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a

MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first class dealers in the United States and British Provinces.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

THE LESSONS OF THE FAIR.—The lessons of the Fair are many and important. We might devote columns thereto, with profit and instruction to all. During a visit in the daytime, when the great evening throng is absent, and the visitors so few that one can study their countenances and movements, one thing most especially strikes the attention of every thoughtful beholder,—the quiet, earnest character of the people. There is no rabble there, intent on excitement; no noise or boisterous conversation falls harshly upon the ear. The lovers of order and law, and the thoughtful workers of the land are there—gathered together to see some new thing, to learn some important fact which has not hitherto broken upon their mental vision; to see, hear and learn that which shall lift them higher and still higher as men and women. The work—the legitimate work of the Fair—the showing and seeing and learning is now fairly begun. About everything is now in its place; the spacious Pavilion is full of the representative industry of the land, and men and women and children are, day by day, quietly but earnestly busy in receiving and treasuring up the lessons which are the legitimate object of such a display.

THE ROCKY MOUNTAIN MINES IN EUROPE. Some leading mine-owners of Central City, Colorado, took the trouble to get up a splendid exhibition of their rich ores at Paris, last summer, which compared so favorably with the minerals from other countries on exhibition there, that the French Government authorized one of the Professors of the *Ecole des Mines*, Simonin, to visit the Rocky Mountains, and report the results—which have been looked for in the *Journal des Mines*, but have not yet appeared. Simonin arrived at Central City in company with J. P. Whitney, a Bostonian mining operator, who has identified himself with that section, about the time or soon after the close of the Exposition last Fall, and was received with great distinction by the miners and capitalists there, who have been forced to look for every assistance that practical and scientific experts, from whatever source, can afford them in the reduction of their mixed and difficult ores of gold and silver containing large percentages of the anlphides of copper and lead. Mr. Whitney has since then been in London, and is reported to be forming a company for the purchase of a group of mines close to Empire City, on Clear Creek. The processes of amalgamation in Colorado are modified in many cases very considerably from the usual details of procedure in Nevada.

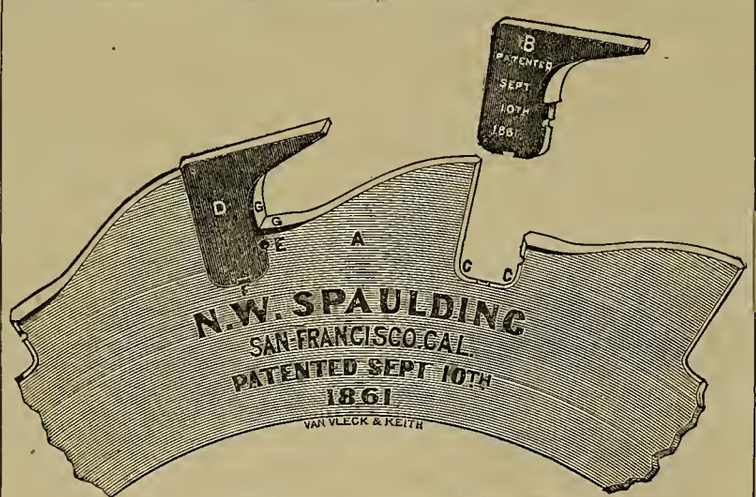
EDITORS PRESS:—In experimenting on the use of "cadmium in the assay office," as spoken of in the MINING PRESS, page 95, Vol. XV., I find that it is an excellent precipitant of silver; but as it also precipitates copper and lead, its use in assaying the former metal must be very limited.

C. H. A.

Lone Pine, July, 1868.

HAVE you lost your spectacles? perhaps you never had any, but need a pair. Muller keeps every variety at No. 205 Montgomery street, not far from Bush.

Spaulding's Patent Movable Saw Teeth.



It is now more than thirty years since movable teeth have been inserted into small saws, such as are used for sawing shingles, clapboards, etc. But it is only quite recently the true principle for their proper insertion has been discovered and practiced. For many years after the employment of movable teeth was attempted in large saws, so much difficulty was encountered from the cracking of the plate, that their use was but very limited, and many who had essayed to use them were compelled to drop them and go back to the solid teeth, on account of the impossibility of making the plates stand. The plates always gave way in the angles of the sockets made for receiving the teeth; and when a crack was once commenced, it was sure to gradually increase, and progress toward the center of the plate until the saw become worthless. After a while the practice grew up of drilling a small hole at the extreme end of the crack, which often served to stay the progress of the same. From this idea, Mr. N. W. Spaulding, of this city, conceived the idea of making the sockets on circular lines. After a little experimenting, sufficient to prove the value of that mode of setting teeth, Mr. S. patented his new method of setting teeth. The claims upon this patent, which bears date Sept. 10th, 1861—re-issued April 21st, 1863—read as follows:

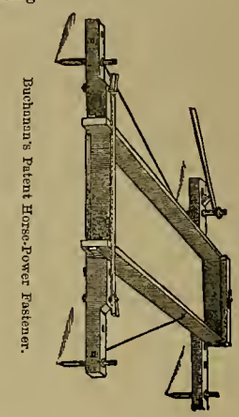
What I claim as new, and desire to secure by letters patent, is:—1st, Forming the recesses or sockets, in saws or saw-plates for detachable or movable teeth on circular lines, substantially as and for the purposes herein set forth

2d. In combination with sockets or recesses formed in saws or saw-plates, as herein recited, I claim teeth having their base or bottom parts formed round, or on circular lines as described.

The illustration herewith given clearly exhibits the form of Spaulding's Movable Teeth, and of the socket into which they are inserted. A represents the saw-plate, B the adjustable tooth, C C the socket, D the tooth when fastened into the plate, E the rivet for holding the same firmly in its place. F shows a small key-seat, placed in the bottom of the tooth for the purpose of allowing a key to be driven under to raise it out of the slot. G G shows the flanges of the tooth and edges of the saw.

These teeth are made and inserted by Mr. Spaulding as a private business of his own, but carried on in connection with, and in the Pacific Saw Company's Factory, at Nos. 17 and 19 Fremont street, in this city, of which company he is a member. A full description of these works was published on Thursday. Mr. Spaulding employs some twelve hands in his especial business of making and inserting artificial teeth. The process is nearly all done by machinery, and by the most skilled workmen which the country can produce.

SPAULDING'S PATENT MOVABLE SAW TEETH.



The introduction of the circular socket formed a new era in the saw business—rendering the use of movable teeth perfectly practicable, and greatly reduced the running costs of saws. The successful introduction of these teeth, together with some other but less important improvements, has within a few years nearly doubled the capacity of any given saw for work. A saw once cutting 10,000 feet of lumber per day, can now be made to cut fully 20,000 feet. The feed was then 1½ inch, when it is now 3-inch.

Among the advantages of movable teeth, is the fact that they can be made to carry more feed, cut easier and with the use of less power, and be kept in order at half the price of fixed teeth.

In addition to the foregoing illustrations, we refer the reader to the last column of this paper, which contains further illustrations of various saws manufactured by the Pacific Saw Company. We are always pleased to note improvements in home industry, when worthily conducted.

Buchanan's Patent Horse Power Fastener.

This newly patented device for confining horse power, for threshing machines and other purposes, is meeting with much success, and saves a great deal of time and money to farmers in the hurrying season of harvesting.

The cut shows how the frame of the thresher is fastened by means of rods at the side, and keys at the end, to the frame that is staked firmly to the ground by means of the four iron pins. When firmly driven into the hard, dry adobe soil of California, these pins are easily and quickly drawn without the use of any tool other than a stick of hard wood or crow-bar, as shown at the upper left hand corner of the engraving. The washer, which operates loosely on the pin, is raised sufficient to admit the end of the lever, and the upward pressure on one side causes it to clasp and raise the pin. Upon raising the lever again, the washer falls from its own gravity, taking a fresh hold, and thus the process is repeated. Mr. Walter Buchanan, Solano county, is the inventor and patentee, to whom letters should be addressed for information.

IMMENSE YIELD OF WHEAT.—The papers published in San Joaquin County are loud in their praises of certain sections of that county, which have produced upwards of 40 bushels of wheat, and 85 bushels of barley to the acre. There is on exhibition at the Fair, some heads of Chili club wheat, raised in Los Angeles County this season, which yielded 80 bushels to the acre; on the same farm, the barley yield was nearly 100 bushels to the acre. While the yield in San Joaquin has been immense—extraordinary as compared to that in other countries—it is nothing extra for California. Such is the nature of the soil and climate of this highly favored State, that many fields of wheat, which have been cultivated with that grain almost continuously since the days of the missionaries, produced better crops this year than ever before. This, too, without the use of any manure or fertilizer, except such as Nature herself provided—in rain and sunshine. We should like our agricultural contemporaries to inform the public whether they know of any other country equal to California as a producer of wheat and barley.

Our Industrial Fair.

[From the Mechanics' Fair Daily Press.]

General Review of the Exhibition.

CLASS III.

Mining Machinery.

Though there is not a very full representation of what might be exhibited in this department, there are many new things still coming in, and the machinery is generally found in working order, and is set in motion during those hours when power is at the disposal of the exhibitors. We give to-day a summary of all that is to be seen at present, belonging to this class.

A small Hepburn's grinder and amalgamator is at work on some ore, where the visitor first enters the department. Hinkle & Capp's grinder and concentrator, next, are fitted up in connection with each other, but have not yet been put in operation. Everything seems to be in readiness, however, and some bags of ore are standing in waiting. Varney is just bringing in his pans and rock-breaker to-day. Hendy's and Hungerford's concentrators are at work alongside of each other, and have been going since the opening of the Fair, but on account of the inconvenience of getting the pulp and water to and away from the pans in the exhibition building, they have not been actually engaged in the concentration of any ore. Pumps are on hand in great variety, and they are still coming along, Cameron being the principal exhibitor thus far. A little wooden stamp mill is shown, with a lever arrangement to raise the stamps, so that the power which is requisite can be supplied by hand, though the number of strokes per minute is necessarily reduced. Formhall's hydraulic blower comes next, but the belt has not been attached. A device for running cars containing water and ore up an incline shaft of varying inclinations, without altering the level of the car, is on exhibition by an "honest miner" who has neglected to attach his name to that article. That globe hydraulic nozzle, and globe-pipe coupling of R. R. and J. Craig, of Nevada, is looked at by practical miners with a good deal of interest. McAuley's rope-knotted hydraulic hose covering is seen depending from the rafters. Another concentrator, by J. C. Kernan, is new in principle. It looks like a little iron cupola furnace, on its four legs, and consists of a large upright iron pipe, four feet in hight, with another similar one inside of it. The water and pulp fall into the inner pipe at the top, and rise again between the two, leaving the gold and sulphurets at the bottom, while the light and earthy ingredients are carried along and flooded over the rim of the outer pipe. Another concentrator is also to be brought in by Dr. Cox, the foundation for it having been put in readiness to-day. A quartz crusher will be put in operation at the door of the side entrance to the Exhibition. In the way of furnaces and roasting processes, there is nothing. Selby's three or four specimens of slag, antimonial lead, and antimonial oxide skimmed from the preceding, are the only metallurgical products. The ores of silver, and quicksilver, are scarcely represented. There are fine specimens of gold and sulphuret ores exhibited from Grass Valley, which will be treated of under class XI.

CLASS IV.

Naval Architecture.

Articles under this head are scattered throughout the entire building, comprising not only vessels of every description, but also tackle, rigging, pumps, and cordage, of hemp and of wire. There is a complete assortment of blocks and tackle from F. F. Mitchell's block shop. A detaching apparatus for boats, etc., by Mr. Adams, has been fully described in the MINING AND SCIENTIFIC PRESS. It is an iron block, with a ring or clevis, which opens like a pair of nippers when the object is to be dropped. Hallidie exhibits a variety of iron and steel wire ropes, round and belt-formed, for shipping and mining purposes. Copper paint, for ships' bottoms, is shown by Hill & Ferryn, together with a case of specimens of ship barnacles, mussel shells and grass, which do not attach themselves where their paint is used. The horers are also represented, in alcohol, with some specimens of their nicely executed work. Tuhbs & Co. exhibit some California-made hempen rope. Wittram's patent anchor attracts attention as an ingenious device for the better securing of a hold to unfavorable ground. Some pump gear adapted to shipping is shown by C. W. Smith. There are models of ships and boats by Jacobson, Larsen, Cousins and Haley; and two full-rigged models of ships especially worthy of mention, on account of their completeness, viz: a model of the clipper ship Young America, and a miniature ship called the Sam Marion, after its builder. The latter is surrounded by an attractive collection of sea shells.

CLASS V.

Military Engineering, Etc.

This comprises also accoutrements, firearms, camp equippage, gunpowder, matches, and fire-works. Several masterpieces of shot-guns, with finely working locks, are shown as a specialty by Wm. Rudolph. Liddle & Kaeding have an assortment of fine things in the way of rifles and pistols of different patents, but show also swords and boxing gloves as appendages of the military art, and some fishing tackle. Schueider & Browning represent rifles as their specialty. Several very large and heavy telescopic rifles, for distances of a mile and over, remind one more of artillery than anything else. Since the Berdan regiment distinguished itself at the war in the use of the telescopic rifle, the art of shooting far, with all the nicety and science of artillery practice, seems to be in favor with riflemen. Powder is exhibited from the Pacific Powder Works in Marin County, and from the powder mill at Santa Cruz. A variety of qualities, for different purposes, as bunting, mining, and common powder, of every grade of coarseness and fineness, are shown by both companies, in cabinet bottles, cannisters, and kegs. Fuse for ordinary mining, and submarine purposes, is exhibited by two manufacturing companies which make that their specialty—the California Fuse Company, and by Brickfordt and Co. A variety of hemp, water-proof, and tape fuses, are shown together with the raw materials. The Eureka Match Factory is very showingly represented, in the display of the entire process of match-making from beginning to end, including the chemicals used, and a revolving pyramid of finely labelled commercial packages, topped off with a feminine "match for anybody." Newhauer, of the San Francisco Match Factory, is also reported present somewhere in the Fair. Fireworks are exhibited by Church & Clark, on the wall over the entrance.

CLASS VI.

Civil Engineering and Architecture.

The Nonpareil Fire Escape, exhibited by E. Hawtborne, is an iron cage covered with canvas, and furnished with rope and pulley attachments, with which one can safely descend from any window to the ground in case of fire. McKenzie's Self-adjusting Truck for raising and clearing flags, is a contrivance for fastening the halliard pulley at the top of a flag pole, so as to avoid fouling on the wind's changing, by permitting the pulley always to swing to leeward. The Eureka Hoist, exhibited by Johnson, is an ordinary hotel elevator, worked by rope and pulley. The cage is very similar to the approved modern mining cages, and there is an improved "safety clutch," to break the revolution of the pulley attached to the cage. Sweet's Window Spring and Sublett's Catch, are handy inventions, which come under this head as building contrivances. Hunt's Windmill is a simple and economical form of that ancient motor. Bodwell's may be seen in operation outside of the Pavilion. A metallic sewer valve, to connect cement pipes with side joints, is exhibited without the name of the owner. Eagan Brothers exhibit specimens of their asphaltum concrete roofing, sidewalks, drain pipes, and iron water-pipes lined with concrete. They are made by pressure, and are very durable. The cementing substance is a thickened petroleum, and comes from Santa Barbara. Menant's Asphaltum Company produces an article for pavements, and other uses where toughness is required, which is set forth to be "as hard as a rock." Skinner exhibits a lot of his patent pressure sanitary pipe, from the works at the Mission. They resemble Eagan's, and the raw material is likewise brought from Santa Barbara. Ordinary earthy cement pipes and drains are manufactured by the potters, and will be spoken of in that connection. J. F. Fulton exhibits a large amount of solidly manufactured leather hose, and some nozzles for firemen. Levey's Fire Extinguisher is put up on the knapsack principle, with a rubber tube and nozzle, to apply it in theaters, hotels and ships; but in all the descriptions and laudatory certificates there is no mention made of the nature of the mysterious substance used, or of the chemical principle which is claimed to be turned to such useful account. D. D. Hayes exhibits a hook and ladder fire-escape. Several very finely made, dark-colored engineers' instruments, represent the workshop of John Roach, viz.: a solar compass, made a little differently from the Troy instrument; an ordinary surgeon's compass with a vertical limb attached to the diopter, intended for miners' use; and a transit; the appearance of all of which is very creditable. A drawing of an improved suspension bridge is exhibited by Swyney & Smith.

CLASS VII.

Philosophical, Dental & Surgical Instruments.

Some interesting articles are shown in the case of Lawrence & Houseworth, amongst them a large artificial eye, illustrating the situation of the delicate muscles and nerves of that organ. A binocular microscope, and a handy pocket surveying compass to be used on the end of a cane, for horizontal as well as vertical angles, are worthy of attention. Surgical appliances and dental productions complete the representation of this class, if we except the engineer's instruments, which have been mentioned under Civil Engineering, the Anthro-photoscope, in the north tower, which has been described heretofore as related to the stereoscope, and the exhibition of stereoscopic cases and pictures in the art gallery, which belong more properly to Class XXI. The surgical appliances on exhibition are: Palmer's leg, by Jewett; Clements' artificial leg; Folleau's anatomical machinery, trusses and legs; and Koehler's trusses, elastic shoulder-braces, and ladies' belts. Dentistry is represented by Drs. Belle, Bush, McAllister, Cool, Colwell, Calvert, Heald, Hutchinson, Lihhy, and McDonald, who exhibit various kinds of dentistry work, and dentists' materials.

CLASS VIII.

Steel and Iron Manufactures.

This class comprises a little of everything, including tools, locks, and brass, copper, tin, lead, and cosmopolitan manufactures. The articles are necessarily scattered and difficult to group, but they embrace some of the best things in the Exhibition. We have taken notes of and classified all the articles that we saw under this head, which will be found located, however, sometimes in widely different parts of the building.

Goff's Patent Portable Cross-head, Wrist Pin and Crank Pin Lathe, is an excellent example of the utility of labor-saving machinery. It is a small portable machine to be applied to unevenly worn cross-heads, wrist pins, and crank pins, in engines aboard of steamers, locomotives, or other machines which cannot be conveniently taken to the machine shop. The work is now necessarily done by filing, or a number of hours or days have to be lost in getting out the part requiring repair. With this machine it is easy to make a straight and true pin, or steamship shaft, on the spot. The advantage is that the pin or shaft being true, there will be very little wear in the box, and the entire machinery will run so much the better, and longer. It is a simple but very praiseworthily devised invention. V. P. Wilbert's Safety Hook for mining purposes, will be appreciated by those who have experienced the sensation of a bucket's grazing down unexpectedly, past the rim of their hat. A simple slide with a spring catch, opens and closes the hook with but a single motion of the hand. Steel carriage springs of merit, by Betts & Fookes, are subjected to test under screw pressure for the edification of those interested. Blake's Safety-Valve for fire hose, is a necessary appendage to the appurtenances of the steam fire engine, to avoid getting on too much pressure, and thus bursting the hose. When the pressure is over eighty pounds to the square inch, a spring lets out the water laterally. The castings for a Carvalho's superheater show the economy and simplicity of that application to ordinary boilers for the drying of steam or preventing of condensation in the leading pipes, and consequently the economizing of fuel. Marsh & Pillsbury's blower is a compact and efficient little machine adapted to forges and small blast furnaces. The Formhall blower is described in all the metallurgical books as the Cargniadelle, after the name of the original inventor. It is a cylinder containing spiral windings immersed in water, the revolution of the cylinder and flow of water in the windings, pressing the air violently out at one end, and is a very economical machine where the communications admit of the transportation off so bulky an article. A specimen of boiler work is on exhibition from Risdon's Locomotive Works, and there are some heavy forgings for large street trucks, intended to carry many tons weight, from the Pacific Forge. Rudolph exhibits an imported turning lathe, suitable for either wood, iron, or brass work; a serviceable article, being identical with the lathes used for practical instruction in wood and metal work at the Royal *Arbeiter Schule* at Munich. A beautiful little case of tools for making screws, is exhibited by Charles Watson.

Scales, there are on exhibition a sufficient number and variety to enable a body to make a study of the article. Fairbanks & Hutchinson are extensive exhibitors, showing every size of article, down to the kinds adapted to druggists' uses. F. H. Pratt, of San Rafael, has invented an adjustable column for ordinary platform scales, a specimen of which may be seen applied to one of Fairbank's Scales. Peterson & Jones' spring and treadle titanic blacksmith hammer, has been mentioned heretofore. Thomas exhibits some ordinary blacksmiths' bellows o 'California manufacture.

The Pacific Saw Manufacturing Company exhibits a splendid array of everything belonging to their specialty, presenting a flourishing aspect which is gratifying to our local pride, and suggestive of the wealth and influence which are destined to grow up under our eyes in the establishment of a hundred other similar branches of manufacturing on the Pacific Coast. They show also knife-blades, and tools for mitering, and for sharpening saws.

The American Saw Company occupies less space, in another part of the building. Everything useful and necessary, however, in the branch, is shown, and a specialty of theirs observable is the punching of holes behind the teeth, for the purpose of catching sawdust, and thereby permitting the saw to run more freely.

Enormously powerful iron-cutting shears of different kinds, to be driven by steam and belt, or by hand-power, are on exhibition from the Pioneer Iron Works, of Kittredge & Leavitt, who have also a powerful punch, which goes through half-inch plates of iron like leather; and a small lodging house in the shape of a safe, the attractive feature of which is a mammoth Bussey's Combination Lock of sixteen bolts, requiring no key.

A band machine for drilling iron, and some patent garden hoes, represent the establishment of Nelson & Dohle.

Some plain house safes, painted in imitation of wood, stand next, without any label, and then there is a fine, large, plain safe by Jonathan Kittredge.

Cascholt has a case of beautifully made silver and plated ornamental carriage hardware, lamps, etc.

Horse-shoes of different form for special uses are shown by M. Grogan, and by Misgill & Cooper.

A concealed door spring which is fitted into the door itself, and draws it back to its closed position; together with a "joint butt," being a double door hinge, permitting the door to be opened in or out like those at the Mercantile Library rooms, are exhibited by W. R. Doty. There are California inventions by B. F. Barker.

A saw-steadier, for delicate and accurate sawing, has no name upon it, as is also the case with a small Bussey's Combination Lock close by, the working of which can be better studied on Kittredge & Leavitt's Safe.

Hoffman's Patent Shutter-holder, enables the occupant of a room to keep his shutters

as far opened or closed as he chooses, in any kind of wind, and it is so simple, and easily applied, that it will cost next to nothing, and may be procured by any independent bachelor who has been in the habit of having his temper spoiled about the landlady's shutters.

Cramer's Patent Door-plate and Letter-box combined, is a sliding door-plate revealing an aperture for letters.

Rotating bench-vices, Hoar's patent, and a self-clinching whip-holder for buggies, are exhibited without any name, unless it be Marsh & Pillsbury's, who are located in the vicinity, and exhibit Jo Improved Axle,—the improvement consisting of a rounded up shoulder where the square portion joins the spindle, and a close-fitting countersunk collar; besides a case of blacksmiths' and masons' hammers of all shapes and sizes.

The Pacific File Works have a case of *chefs d'oeuvre* in their specialty, which may be looked at as one of the landmarks of our manufacturing progress; including some reaper's and mower's teeth with file edges.

Charles Henry exhibits a fine case of molding, carving and turning chisels.

Peculiarly constructed sheet-iron chimney tops are exhibited by Murtha & Co., who have also some artesian and petroleum well pipes. The Union Ventilator seems to be something similar to Murtha's top, but is more especially adapted to keeping out sand.

Lead products in the form of shot and pipes of every size, and sheets for special purposes in trade, are exhibited by Mr. Selby, together with a few specimens from his smelting furnace at North Beach. A pile of block tin pipe occupies part of Mr. Selby's space.

In the way of manufacturing, an event is to be chronicled in the exhibition of the first printing press manufactured on this coast, by Palmer, Knox & Co., of the Golden State Iron Works. It is a Washington hand printing press of large size, adapted to the use of country offices. Several of them have already been sent out to different parts of the State, and are working with complete success. There is a considerable saving in cost on this machine, as compared with Eastern machines, and another advantage worthy of consideration, is that whenever anything is broken, it can easily be resupplied.

Stoves and Cooking Apparatus.—A variety of petroleum stoves and other handy family contrivances appertaining thereunto, are shown by Bullard, who has also an automatic coffee roaster, revolved by a spiral spring. Tay, Brooks & Backus exhibit stoves and cooking ranges, with all the useful appurtenances, and a patent sprinkler and nozzle combined, for gardens, streets, windows, and fires. A screw is turned, and it ceases to be a sprinkler, and becomes an ordinary nozzle. Holbrook & Merrill exhibit the Peerless cooking range with an accompanying stand for pails and plates, and a variety of tin, sheet iron, and copper ware. Similar articles are attractively displayed by A. C. Taylor, viz., a portable stove, the doors and flue plates of which are dessicated or filled in with cement where it is to be set up, making it equal in non-conducting properties to the porcelain stoves which are so universally preferred and used in Continental Europe; a kitchen sink, with a self-cleaning trap or turning table, dish-pan and strainer; and a slop-hopper, with a self-cleaning trap to connect with sewers and cess-pools. John Bohm is present with the productions of the Barstow Stove Company, of Providence. An extensive and interesting display of coal oil lamps for cooking and heating purposes, occupy the space appropriated by John B. Owens. Many really useful devices may be seen there, as the attachment of a water boiling apparatus to an ordinary lamp. Bachelors and maids generally interest themselves in household mysteries to the extent of stopping to look at these articles.

A patent cake-mixer, exhibited by Davis, commends itself to housewives who wish to economize elbow grease. T. C. Walters shows a little wooden model of a patent cooking range which has been devised by him.

Tools and Cutlery.—A horse shoe nail nipper, which clinches and cuts off the nail at the same time, and an adjustable gas-pipe tong, adapted to seizing any object, are exhibited for other parties by Mr. Barlow, the representative of the Wittram anchor. Charles Ott shows a case of bits, squares, plumbs, and other much-used tools, of his own manufacture. A case of carpenter's and other mechanics' tools, of good quality, is exhibited by P. Quigley.

The California Tool Works of Weichart produce specimens of work, presented in a neatly gotten up case at the Fair, which will strike any one not acquainted with the advance of the manufacturing capabilities of the coast very agreeably. It is, indeed, a surprise to see such perfect execution and finish in cutlery applied to a tool like the die for cutting delicate and fashionable gloves. We had supposed that an article of that kind would not be needed here for 20 years; but there is no reason in the world why California, with its moderate Chinese labor, should not make gloves and export them to the East. These dies are made so as to cut out at once, through a great many thicknesses of leather, as many gloves as are wanted in the shape required. Besides which there are steel coopers' planers, butchers' cleavers, molding cutters, etc., of equally fine quality and finish.

A self-coring mortising chisel, invented by Hutchinson & Adams, is an economical modification of the ordinary tool, the side lips of which are apt to break off. In this, the side lips of the chisel cut in advance of the chisel, thereby separating the chips at the side, so that they are thrown up, the chisel and mortise are constantly kept clear, and there is scarcely any further labor required in cleaning out the mortise after the chisel has done its work.

The manufacture of cutlery is splendidly represented by Will & Finck, who have several large cases of the finest articles, comprising knives, corkscrews, shears, gauging tools, etc., many of which are of home manufacture.

Brass Manufactures and Bell Hanging.—A large case, illustrating at a glance the entire science of wire-pulling as practiced in hotels—presenting a labyrinth of wires which produces order out of the maze that would otherwise be one of inextricable confusion, and drowsy in its communications as an old country tavern—is exhibited by Will & Finck, bell-hangers. A number of other parties in this branch of business have been enterprising enough to make a fine showing at the Exhibition. Garvey & Kimball display everything in the line, amongst which are some large fixed bells, or gongs.

Gallagher & Weed show, besides all the ordinary paraphernalia of bell-hangers, nozzles, spikes, valves and joints, castings in brass and composition metals, bells, etc.

Garratt makes a still more extensive showing, having on exhibition, besides a number of articles of more special application, as anti-friction metal, steam indicators, steam whistles, valves and the like, and several small brass cannon.

Metal spinning and brass and copper vessels are represented by F. Shoener.

Wire Manufactures.—Spiral springs and other wire manufactures of brass are exhibited by Mr. Hinckley, at the entrance to the music room, intended for bedding, furniture bottoms, etc. The iron and steel wire-rope manufacturing machine of Hallidie may be seen at work, usually in the evening, turning out a very beautiful quality of fine wire rope. One of the most complete exhibitions in any one department, is that of Mr. Graves, from the California Wire Works, representing all the multifarious applications to which wire has attained in modern times, for purposes of convenience and ornament. There are screens of iron and brass, a safety lamp, cheese covers, sieves for ore-dressing and for agricultural and commercial purposes, rat-traps, bird cages, sand riddles, door and window screens, and a very neat and airy-looking summer house, in which the ventilation is so ingeniously natural that there is not any danger of catching a "death of a cold" in it, except by poets and lovers. Seats, and bonnet and clothing stands, are additional uses to which wire is applied, in articles which may be seen.

Broom wire, prettily plated with different metals, chiefly tin, both plain and ornamental, is exhibited by Josbua Gray.

Locks and Safes.—V. S. Parkhurst exhibits White's Thief-Detecting Money Drawer Lock, in connection with the combination locks, which are said to be proof against false-skeleton or duplicate keys. An alarm is attached to the inside of the drawer, which gives loud warning when it is tampered with by unfamiliar hands, affording anything but a joyful sound to the stealthy adventurer. A handy little portable door-fastener, weighing one ounce, is deftly explained by the inventor, Mr. Adams.

The melting and casting of iron in the Fair will be commenced this (Saturday) evening by Hanscom & Co., of the Ætna Iron Works. A 4-inch cupola will be used, which will warm up at least a portion of section 36, and prove an interesting display to many.

"Swinging Round the Circle."—Those miniature ships revolving around the fountain, so gay and sportive, are propelled by an ingenious contrivance devised by Swyney & Smith, whose card appears in to-day's paper.

Mechanical.

Mr. Bourne's Coming Motor.

In our issue of August 1st, we alluded to the new work of Mr. Bourne, and his prediction that the steam engine is to be superseded. We gave also some remarks upon the subject from *The Engineer*. A late number of that journal has an article, a portion of which we condense as follows:

"In what direction are we to seek for a substitute for the steam engine, at once simpler and more economical? Mr. Bourne is silent on this point. Is it to be found in electricity or magnetism? No. It is well known now that in availing ourselves of these forces we draw on no ready store of power at first hand. Frictional electrical machines only convert, by a subtle agency imperfectly comprehended, the power expended at the moment in causing rotation into another form or force. We have presented to us the phenomena, not of the conversion at first hand of power already stored up, but of a conversion at second hand of such power into another form, which, before it can be of use, must be reconverted into one of the shapes which it originally bore. Of induction machines and galvanic batteries, the same holds good. How can these things supersede the steam engine, which practically at a single operation sets free power stored up for man's service millions of years ago in our coal fields? From chemistry we have nothing to hope. Combustion is a simple chemical operation, and when fire first came on the earth chemistry gave us her best gift. She holds nothing back which can do more for us.

"If Mr. Bourne conceives that the coming motor is to depend on electricity or on some undiscovered chemical process, he labors under a great error. We do not think that Mr. Bourne holds any such opinion, and but one direction remains in which to seek the coming wonder. It must be a heat engine, and it must dispense wholly or partially with water. But no large hot-air engines have ever been worked with success. * * * Marine engines with cylinders of 100 inches in diameter must be replaced under such a condition with others of 15 or 16 feet in diameter. Then would come huge air-pumps and regenerators. The machinery would take up as much space as boilers and steam engines together; and all this to save perhaps a quarter of a pound of coal per horse per hour. Surely Mr. Bourne is not justified in assuming that the steam engine is on the eve of being superseded by any known embodiment of any recognized principle of hot-air engine.

"Nor is it a whit more likely that we shall have a universal motor depending for its action on the evaporation of volatile fluids. All the available fluids more volatile than water give off an inflammable or poisonous vapor, which is so subtle that no known joints can prevent its escape. * * * It is due, we think, to Mr. Bourne's readers, that he should either give a reason for the faith that is in him, or retract statements which are likely enough to lead young inventors on a Will-o'-the-wisp chase. Doing neither, he must not grumble if the majority of his readers venture to think that he has written nonsense by mistake, and does not care to own as much."

Relation between Crank and Piston.—When the crank makes a revolution it describes a circle, twice the diameter of which is precisely equal to the space passed through by the piston during the same time: hence, assuming the pressure on the piston to be one pound, it follows that the average pressure on the crank-pin must be equal to the pressure on the piston multiplied by the space through it has passed, and divided by the space passed through by the crank. Thus, supposing the stroke to be one foot, $2 \div 3{\cdot}1416 = {\cdot}636$ = mean pressure on crank; and one pound pressure on piston multiplied by two feet, the space through which it has passed, equals two, the power exerted by the piston; and ·636, the pressure on the crank, $\times 3{\cdot}1416$ feet, the space through which it has passed, $= 1{\cdot}906$ = the power exerted by the crank. The difference between 2 and 1·906 is due to the imperfection of the ratio between the diameter and the circumference of a circle.—*American Artisan.*

"The Wheel."—A funny *felloe* asks us if we have ever seen the second number of our circumgyratory cotemporary, or whether the public are *tired* of "The Wheel." N. B.—It has only made "one revolution." *American Artisan.*

Scientific Miscellany.

Algæ in California Hot-Springs.

Prof. H. C. Wood, Jr., of the University of Pennsylvania, describes, in the July number of the *American Journal of Science and Arts*, some specimens of *Algæ* gathered by Mrs. Partz in the "Benton Springs," in the northern part of Owen's Valley. This lady writes to her brother, Prof. Seidensticker, as follows:

"I send you a few samples of the singular vegetation developed in the hot springs of our valley. The springs rise from the earth in an area of about 80 square feet, which forms a basin or pond that pours its hot waters into a narrow creek. In the basin are produced the first forms, partly at a temperature 124°–135° F. Gradually in the creek and to a distance of 100 yards from the springs, are developed at a temperature of 110°–120° F., the Algæ, some growing to a length of over two feet, and looking like bunches of waving hair of the most beautiful green. Below 100° F. these plants cease to grow and give way to a slimy fungus growth, though likewise of a beautiful green, which finally, as the temperature of the water decreases, also disappears. They are very difficult to preserve, being of so soft and pulpy nature as not to bear the least handling, and must be carried in their native hot water to the house, very few at a time, and floated upon paper. After being taken from the water and allowed to cool they become a black pulpy mass."

Prof. Wood says:—

"This plant certainly belongs to the Nostochaceæ, and seems a sort of connecting link between the genera Hormosiphon of Kützing and Nostoc.

The best algologists now refuse to recognize the former group as generically distinct, and the characters presented by this plant seem to corroborate that view.

The species appears to be an undescribed one, and I would propose for it the specific name *Caladarium*, which is suggested by its place of growth. There are several species of allied genera, which grow in the hot springs of Europe, but no true Nostoc has, I believe, before been found in thermal waters."

Mrs. Partz speaks of animal, as well as vegetable, life, as existing in these springs. She says: "Mr. Partz and myself saw in the clear waters of the basin a very sprightly spider-like creature, running nimbly over the ground, where the water was 124° F., and on another occasion dipped out two tiny red worms."

Fossils from the Cretaceous Formation.—L. Lesquereux has an article in *Silliman's Journal* for July, in description of some fifty-three fossil plants from Nebraska, mostly collected by Dr. Hayden, of the Geological Survey. This makes a total of seventy-three species from the American cretaceous formation. The great number of new species thus established is due to the fact that cretaceous fossils have heretofore been scarce. The writer says that "the more we know of the floras of the geological ages of America, the more we recognize in them peculiar types which in their grouping constitute what may be called an *American facies*, which by successive transitions has passed to our present flora, and assigned to it its general character." These cretaceous fossil plants have a closer relation to our present flora than to any stage of the Tertiary in Europe.

Test for Naphthalin.—The following reaction furnishes, according to Vohl, an exceedingly delicate test for naphthalin. When the substance under examination is treated with concentrated nitric acid, and diluted with water, the resulting precipitate is washed first with water and afterwards with dilute alcohol. It is thus placed in a watch-glass with a few drops of potassic hydrate and potassic sulphide, and evaporated to dryness. On moistening the residuum with alcohol, a magnificent red-violet color is at once developed.

There are at present seventeen lines of steamers, making 1,322 voyages per annum, between England and America.

General Review of the Exhibition.

CLASS VIII—CONTINUED.

[Continued from Page 115.

Steel and Iron Manufactures.

The Ætna Iron Works have been represented only on the books, thus far, but arrangements were being made to-day by the proprietors which will add a very interesting feature to the exhibition. A small cupola blast furnace was to have been brought in and set up, in connection with one of the blowers already on exhibition, for the smelting and casting of iron; all of which is to be done under the eyes of the observing and studious patrons of the Fair.

As the erection of smelting works cannot be completed on a few hours notice, nobody need be disappointed if the work should not begin till Monday. But an excellent opportunity will be afforded here to study the real simplicity of smelting, as applied to the most difficult and easiest smelted of all the metals. The art of smelting iron and brass was taught only a little while after the Creation, according to our best accounts, by a mechanic whose name and renown have been handed down to our day. Tubal Cain, it is recorded, gave instruction to wondering strangers from distant countries, in the art of producing metal by melting the oxides of iron.

On visiting iron foundries, people seldom see the process of smelting, or, if they happen upon it, there is so much complicated machinery around that it appears complicated to them, and the few simple conditions are apt to be overlooked.

A very high temperature is procured through the agency of the blast—that is all; and the smelter must learn how to avoid smelting down his own furnace. The ore is reduced to metal, which separates from the earthy ingredients merely by sinking to the bottom.

Price's California-made cutlery deserves particular mention. Being chiefly silver-plated, it has been placed with the silver ware. His case contains some very beautiful specimens of workmanship.

Dr. Farno's self-lighting gas-burner attracts crowds in the evening, and the idea seems to be practical and useful. By the application of a little thought on the part of the inventor, we are enabled to dispense with the nocturnal amusement of fumbling for matches, and to turn on the gas instantaneously, at any time. The principle is the use of a little side jet, which is always burning whilst the main burner is not in use, and which is prevented from blowing out by an acorn-shaped thimble. When the light is turned off the little burner catches, and when it is turned on the little one goes out. The expenditure of keeping this little burner alight for a year is half a cent, or the use of one cubic foot of gas; and there is always enough gas left in the pipe to keep it burning for days, though the meter has been turned off.

Lumsden & Boone exhibit a patent sail needle.

A little perforating machine for making brass stencil plates, and the like, is shown by Young & Smith.

Quartz screens of all desirable varieties, are exhibited from the Vulcan Iron Works, and from the establishment of H. J. Booth & Co. Punched sheet iron screens, with round holes, or elongated and slitted apertures, having bulged and roughened edges, seem to be most in favor.

B. L. Stoue exhibits a California invented burglar alarm; R. F. Ricchiole some California made chandeliers; Milliken & Johnson, a self-solderiug cock for tin boxes: Mr. Hoffman, some California made tin and wire flower stands; S. M. Briggs, a California invented miter-box; R. F. Ashburn, some oilers and self-oiliug cups; James Sims, a patent gas chandelier and globe reflector; R. P. Thomas, a patent submerged coffee boiler; and J. B. Whittemore, a Schoener patent no-chimney kerosene burner, by the use of which, at a cost of about four bits, any petroleum lamp may be used in the kitchen or in lanterns, like an ordinary candle, without a chimney; D. Stoddard, several governors and injectors for engines; L. Chely, safes; and W. McKibben, a sewer valve. About half a dozen proposed exhibitors have failed, in this department, to make their appearance.

[From the Mechanics' Fair Daily Press.]

Artificial Stone.

There are probably few articles which have been presented for the consideration of visitors to the Fair, entitled to more attention than the artificial stone, manufactured hy the Pacific Stone Company of this city, under the patent of Prof. Ransome. By this process, the sand that lies iu such inexhaustible profusion around us, may soon be converted into palatial residences, into ornaments, statuary, etc. Everything that can he molded with plaster of paris or iron, can be molded into this stone. It is composed of sand cemented hy chemical action between silicate of sodium and chloride of calcium—inexpensive substances. It is said to be equal to the best natural saudstones if not superior to them; to resist heat and cold, and only to improve with age. The scientific men of England and America unite commendingly of it. In Hongkong, China, a very elaborate fountain of this material has been erected, as appears hy a report accompanied with a design, in a late number of the *Illustrated London News*. Orders have recently heen executed, or are in process of execution, from the Bengal, Bombay and Madras presidencies, from Kurrachee, in Scinde, from Tasmania, Adelaide—where the capitals for the columns of the new town hall were supplied by Mr. Ransome's Company—Sidney, Melbourne, New Zealand—where he furnished 126 large Corinthian capitals for the Government building—China, Turkey, Egypt, Holland, and other countries. Among the orders in hand is one for a large number of Ionic capitals for the University of Calcutta.

The process of manufacture is remarkably simple, yet it is based upon the most scientific principles. The sand, chalk or other mineral substance is intimately mixed with its proper proportion of a solution of silicate of soda, by means of an ordinary pug-mill. The mixture is thus rendered of a plastic consistency, when it is either pressed into blocks or molds, or rolled into slabs, or any form that may be desired, and it is then either saturated with, or immersed in, a solution of chloride of calcium, when a double decomposition of the two solutions employed immediately takes place. Thus is formed an insoluble silicate of lime, firmly enveloping and cementing together all the particles of sand or other minerals of which the stone is composed. The cost of production is said to be less than that at which the natural stone can be obtained. The stone proposed to be manufactured by this company has stood the severest test—a parallel bar, measuring four inches by four, sustaining 2,122 pounds, whilst a similar bar of Portland stone broke with 759½ pounds. In another case the stone stood a pressure of 1,980 pounds, whilst the Portland stone broke at 1,104 pounds, the Bath stone at 786 pounds and the Caen stone at 768 pounds. Mr. Ransome's stone has been boiled, and roasted, and frozen, and pickled in acids, and fumigated with foul gases, with no more effect than if it had been a boulder of granite or a chip of the blarney stone. It has no oxidizable constituent; for silica, or silicic acid, is already oxidized, and thus it is unalterable in air, and as the new stone is almost impermeable, it will suffer little if any injury from moisture or frost. Unpretending and unassuming as this stone may seem, the parties who have interested themselves in it venture to predict that it will develope into one of the most important interests in the State. The Pacific Stone Company has, within the past few days, been incorporated with a capital of $100,000, the incorporators being among our most respectable, responsible and reliable business men.

THE NOVELTY OF THE FAIR.—William H. Jessup & Co., Proprietors of the Eureka Match Factory, have made a fine display of their manufacture in all conceivable styles. The great attraction is the tasteful arrangement of their goods on a pyramid surmounted by a beautiful pedestal, on which stands a wax figure, representing a lovely girl, dressed in the hight of the fashion, holding in her hand a finely cut-glass sign, with the words "Eureka,—a Match for any one," over which a handsome sign of the firm, supported by gilt scrolled brackets,—the whole being revolved by means of pulleys and belts attached to the main shaft that runs the other machinery. Mr. Jessup is entitled to credit for the effort made to add to the attractions of the fine exhibition of the present year.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

ISSUED FOR THE WEEK ENDING AUG. 4, 1868.

80,503.—IMPROVEMENT IN CULTIVATOR TEETH.—William B. Ready, Sacramento, Cal.:

1. I claim the groove *C*, in stock a, as a seat for an adjustable point for a cultivator tooth.

2. The movable tongue d, pierced with holes or slots i, i, i, i, forming an adjustable point of a cultivator tooth.

3. The combination of the grooved stock or support a, with the adjustable tongue d, for the purpose of a cultivator tooth, substantially as above described.

80,606.—IMPROVED APPARATUS FOR DISINTEGRATING GRAVEL CONTAINING GOLD, ETC.—J. B. Cox, San Francisco, Cal.:

1. I claim the slotted bottom or floor d, of the tub D, when constructed in several independently-removable pieces, for the purpose specified.

2. The combination of the tub D, slotted floor d, rake F, shaft G, and receiving vessel B, when the several parts are constructed to operate substantially as and for the purpose set forth.

80,612.—IMPROVEMENT IN COUNTING REGISTERS.—Jacob S. Detrick, San Francisco, Cal., assignor to self and Wm. R. Eckart, of same place.

I claim the combination of the lever G, or its equivalent, with the detachable spindle J, and the wheels E, I, when the parts are constructed and arranged so as to operate together, substantially in the manner and for the purposes indicated.

80,629.—IMPROVED MACHINE FOR SEPARATING AND CONCENTRATING SULPHURETS.—Andrew Hunter, San Francisco, Cal. (Antedated July 25th, 1868.)

1. I claim the formation of the trough or table B, with or without metallic lining, and alternately inclining and level, as shown hy lines a, b, d, substantially as described and for the uses and purposes as set forth.

2. The combination with the table or trough B, and its adjustable hangers, of the cam shaft and spring X, under the arrangement described, whereby both the oscillatory motion and percussion of the said table are effected for the purpose of separating the sulphurets and metal from the lighter particles as set forth.

3. The eccentric strap Z, in combination with the trough B, and cam or equivalent means for imparting an oscillatory movement to said trough substantially as and for the purposes set forth.

4. The combination with the table B, and mechanism for imparting to the same an oscillatory movement of the rocking trough E, arranged for operation substantially as and for the purposes specified.

5. The combination with the oscillatory table or trough B, of the rotary scraper W, made of india rubber or other suitable material, substantially as set forth and for the purposes specified.

6. The combination with the table or trough B, of the inclined screen T, and mechanism for imparting to the same a vibratory motion under the arrangement, and for the operation as herein set forth.

7. The combination with the oscillating trough and hangers by which the rear end of the trough is held, of the wheels or rollers R, for supporting the front end of said trough, substantially as herein shown and described.

8. The combination of the table or trough B, with eccentric trough E and G, hangers D, D, spring X, wheels or rollers R, scraper W, and sieve T, substantially as described and for the uses and purposes as hereinbefore set forth.

80,646.—IMPROVEMENT IN MANUFACTURING AND PURIFYING SPIRITS.—Peter Martiu, Forest Grove, Oregon. (Antedated April 4, 1868:)

1. I claim the manufacture of alcohol and other spirits in the manner substantially as herein described.

2. The use of saline matter for manufacturing and purifying spirits, in combination with my said process substantially as described.

80,718.—IMPROVED MEDICINE.—Emil Frese, San Francisco, Cal.

I claim the above described composition for Cathartic Tea, made of the ingredients enumerated, mixed and compounded in about the proportions specified.

80,738.—IMPROVEMENT IN VALVES FOR STEAM ENGINES.—William D. Hooker, San Francisco, Cal.:

1. I claim the recesses *o o'*, in the piston *b*, arranged with reference to the ports *h h'*, substantially as herein set forth and shown.

2. The arrangement with relation to the cylinder *a*, valve-chamber *c*, and the additional puppet-valve chamber of the valve *d d'*, with its recesses *u u'*, supply port f, ports *g g'*, *h h'*, *i i'*, *e e'*, vents *q q'*, exhaust ports *j j'*, ports *s s'*, and puppet valve *r r'*, substautially as herein described and shown.

80,739.—IMPROVED AMALGAMATOR.—Alfred Horn, Silver City, Nevada:

1. I claim in combination with the annular chambers B, and B'. I claim the connecting groove or grooves D D, substantially as and for the purpose specified.

2. The incline projection or scrapers F F, cast at the end of the shoe, conforming to the natural wear of the shoes and dies without adjustment, substantially as described.

3. Attaching the wings G G, by the bevelled slots H H, and lugs H' H', substantially as described.

Weekly Stock Circular.

y Associated Brokers of the S. F. Stock and Exchange Board
San Francisco, August 22, 1868.

Financial.

Gold in New York, August 21st, at 3 P.M., 144⅛.

The independent character and condition of California was never better exemplified than at present. While business is suffering extreme depression in the Eastern States and all over Europe, it is healthy and vigorous in its country. Our local money market, the financial thermometer, exhibits a very marked increase in the demand for cash, arising from legitimate mercantile transactions, the moving of our heavy crops, the amount and value of the improvements going on in nearly all portions of the city, and for settlement of Eastern bills, rendered advisable at this period by the rise of gold and the corresponding depreciation of paper money. Rates in bank remain rigidly fixed at long existing quotations, 2@1½ per cent. per mont. The demand upon our savings institutions is very urgent, mortgages being effected for large amounts, upon a monthly repayable basis, at 1 per cent. The surplus of cash has been largely diminished in consequence of this general activity. Gold Bars are weak at 880@890; Silver Bars rule from par to ⅛ per cent. premium; Currency Bills on Atlantic cities are quotable at 41@42 per cent. premium in Gold; Sight Drafts, payable in Coin, ¾@1 per cent. premium; Telegraphic Transfers, 1@1½; Sterling Exchange, 48¾@49d; Commercial Exchange, 49¾d.

The sub-Treasurer shipped another half million of dollars by the N. A. S. S. Co.'s steamer, Original which sailed on the 20th August, making a total of $7,000,000 so far this year, being $1,500,000 more than he shipped in all of 1867. If the official under whose orders these further shipments are made will not consent to remove the veil of secrecy, he should at least give some good reason why it is continued.

City Stocks.

The market for miscellaneous shares is dull, and for the past week sales have been confined to a few leading incorporations. Spring Valley Water Co. stock was in the market at $66@65 75, and a few shares of California Steam Navigation Co. stock sold at 69¼@69 per cent. Twenty shares of the San Francisco Insurance Co. sold at $105 per share. This company is now winding up its affairs, having voted to disincorporate a short time ago.

The receipts of the local insurance companies during the month of July and previously this year, according to the returns in the hands of the Internal Revenue Collector of this district, have been as follows:

	July.	Previously this year.	Total.
Pacific	$75,688	$368,857	$444,525
Union	36,400	198,214	134,614
National	....	201,253	201,253
Fireman's Fund	18,557	113,885	132,142
Builders'	21,376	121,056	142,432
California	10,987	76,050	87,037
Merchants' Mutual Marine	23,710	97,727	121,437
Accidental	12,304	40,595	52,899
Home Mutual	13,714	60,173	73,887
San Francisco	....	25,954	25,954
People's	7,080	38,434	45,514
Totals	$219,736	$1,341,958	$1,561,754
Same time in 1867	192,109	1,054,257	1,246,366
Increase in 1868	$27,687	$287,701	$315,388

The returns were made upon a legal tender basis, the tax—72 cents for January, 71 cents for February, 72 cents for March, April, May and June, and 70 cents for July—being fixed every month by the Assessor of the district.

The National and San Francisco have disincorporated and their outstanding risks have been transferred to the London and Liverpool and Globe Insurance Company.

The above statement shows an increase of $24,822 as against the receipts in June. The receipts of the several companies in July, as compared with June, show the following difference:

	Increase.	Decrease.
Pacific	$20,831	.....
Union	15,892	.....
Fireman's Fund	1,706	.....
Builders'	.....	2,998
California	.....	8,241
Merchants' Mutual Marine	5,261	.....
Accidental	1,840	.....
Home Mutual	.....	366
People's	463	.....

The receipts of the city railroads for the month of July and previously this year, have been as follows:

	June.	Previously this year.	Total.
Omnibus	$28,826	$146,919	$175,745
North Beach & Mission	24,664	129,570	154,234
Central	15,464	80,792	96,256
Front Street, Mission & Ocean	9,317	48,434	57,751
Market Street	11,344	49,494	60,838
Potrero and Bay View	2,803	10,566	13,369
Totals	$92,418	$465,775	$558,193
Same time in 1867	77,914	375,815	453,729
Increase in 1868	$14,504	$89,960	$104,464

Showing an aggregate increase of $5,466 in July over the receipts of June. The receipts of July as against June show the following difference:

	Increase.	Decrease.
Omnibus	$1,872	.....
North Beach and Mission	1,939	.....
Central	928	.....
Front Street, Mission and Ocean	639	.....
Market Street	871	.....
Potrero and Bay View	17	.....

The receipts of the San Francisco and San José Railroad were $59,823 in May; $51,425 in June, and $52,502 in July.

Mining Share Market.

The mining share market has obtained a healthier condition, and a very material rise is perceptible in several the Gold Hill claims on the Comstock Lode. The depression which has continued for so long a period is about being lifted, and under the favorable developments some of the drifts, and the reasonably fair prospects the future, we may soon look for greater improvement. The great desideratum to work more successfully in the lower levels has been that of air, which now being supplied through blowers, the Chollar-Potosi Co. having one in successful operation, and the Hale Norcross are about putting one up. In relation to the latter the *Trespass* has the following: "The Hale & Norcross Mining Company received from the manufacturers Stockton, California (Keep & Blake), a machine known the 'rice-blower,' which is to be placed in position at the mine to force fresh air into the lower levels. The paratus is quite a curiosity, and is destined to come to general use and be of incalculable benefit to our mines. It will be run by a separate engine, and to his understood must be seen. This is the first 'rice-blower,' yet imported for use at the mines, but several have already been ordered by the Imperial and other companies. It is small, but has great power, and will force a continuous and large volume of air to any desired depth, while the cost of production of the few pounds of steam required to run it will be trifling." At the close, the market is active, with an upward tendency in prices.

SAVAGE—has been quite steady since our last issue, selling at $109@113, and closed at $112. For the week ending Aug. 15th 1,210 tons of ore were extracted, showing an approximate value of $38 21 per ton. The ore came from the following localities: Bird station, north mine, 69 tons; fourth station, north, 52; fourth station, south, 911; fifth station, north, 30; and fifth station, south, 148. During the three previous weeks 2,873 tons of ore were sent to the mills. The various breasts do not look quite so well; however, new ore faces are being opened, from which they had been cut off for nearly two weeks for want of air and the necessity of filling, and these will increase the product considerably. In the north mine on the fifth station there is no change worthy of note, while the south mine shows considerable improvement over last week. In winze No. 1 they make slow progress, owing to a large amount of water and hard rock, and winze No. 2 has been sunk over twenty feet, continuing in good ore. The north drift from the sixth station is in hard porphyry, and the south drift, same level, is now entirely in quartz, but has not improved sufficiently to enable them to save any ore from it. The mills are running full. Receipts of bullion for August to date, $92,000.

IMPERIAL—improved from $108 to $120, then sold at $112@118 50, and closed at $116. On the 17th inst. the Superintendent wrote as follows: The rock in the Imperial-Empire shaft is not so hard as it has been. The shaft is now 33 feet in depth below the 900 level. The "raise" progresses slowly on account of the great heat. The winze on the 700 level of Alta mine is 13 feet deep, and its course is running over the ore, leaving it on the under side of the winze. Three shifts had been put on in raising on ore above the 700 level. About 130 tons of ore are now daily taken from the mine. On the 14th inst. $3,578 in bullion was forwarded from the Gold Hill mill, and on the 19th $8,999 from the Rock Point mill, making $19,033 so far for the present month.

KENTUCK—has been in good request, rising from $381 to $450, and closing at $425. The receipts for August to the 18th inst. foot up $51,035, against $38,148 same time in July, and $23,717 in June. The bullion returns for the present month, from present appearances, will exceed those of any previous month since the existence of the company. Recently they have found a small stratum of excellent ore on the 800 level, in addition to the heretofore favorable developments.

CROWN POINT—was in better demand at improved prices, selling at $80@88 50, and closing at $90. The stopes look as well as usual, and, generally, this mine promises well for the future. The east drift from the 900 level is in fine looking quartz, with considerable pay ore. The winze to the 900 level is 80 feet in depth. The south drift from the 900 level is in 161 feet, running in quartz, and it is thought the ledge will be reached at a distance of 200 feet—about 40 feet more than the present extent of the drift. The receipts of bullion to the 18th for the present month aggregate $31,513. A telegram of the 21st, says that the winze is 91 feet in depth, and the drift on the 900 level extended 163 feet; rock soft, with considerable pay ore scattered through it.

AMADOR—declined from $238 to $224, rose to $227, and closed at $229. The receipts to date for August foot up about $22,500. During the above run the Badger mill was idle about a week. A dividend of $2 per share was paid on the 20th. The general appearance of this mine shows some improvement over previous reports.

CHOLLAR-POTOSI—improved from $134 to $155, and at the close realized $157. During the week ending August 14th the yield of ore has been increased to 1,157½ tons against 760½ the previous week. The operations of a "blower," recently introduced to force air to the lower levels, have been very satisfactory, having reduced the temperature about forty degrees.

OVERMAN—has been in marked favor under a material rise, improving from $80 60 to $110, and closing yesterday at $100. On the 15th of August the drift on the 400 level was carried through the clay wall, running in "lively" looking quartz, and the Superintendent reports that "in a few days we may expect to strike a body of ore on this level." $4,421 in bullion came down on the 20th.

ALPHA—has been in favor at an advance, rising from $47 to $53, declining to $50, and closing at $51. On the 250 level the south drift has been connected with the Imperial workings, where they found some very fair ore, and they expect to be more successful in a few days.

HALE & NORCROSS—has been quite active at the close, selling at $73. The "blower" has improved the air very much in this mine.

The sales in the Board during the past week have been as follows: Open sessions, $567,118; regular sessions, $1,894,675—total, $2,461,793.

THE *New York Tribune* says the reason why Plantation Bitters are so generally used, is owing to the fact that they are always made up to the original standard, and of pure material, let the price be what it will. The *Tribune* just hits the nail on the head, for Plantation Bitters are not only made of pure material, but the people are told what they are made of, as the recipe is wrapped around each bottle. Don't go home without a bottle. *

CONCERT.—It is the intention of the proprietors of Woodward's Gardens to give a grand Instrumental Concert every Saturday and Sunday, at 2 o'clock P. M., at this well-known and well-patronized place of resort.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Aug. 21, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.			Per ton.
12 per cent. ore	$16 00	22 per cent. ore		$43 56
13 " "	18 62	23 " "		46 45
14 " "	21 20	24 " "		49 33
15 " "	23 85	25 " "		52 22
16 " "	26 25	26 " "		55 11
17 " "	29 12	27 " "		58 00
18 " "	29 91	28 " "		60 80
19 " "	34 90	29 " "		63 77
20 " "	37 78	30 " "		66 66
21 " "	40 67	31 " "		69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

HEARST SILVER M. CO.—August 14th. Idaho Territory. Capital stock, $200,000; 1,200 shares, $1,000 each. Trustees: Geo. Hearst, J. W. Mackey, S. Heydenfeldt, L, Sloss and J. W. Gashwilder.

PACIFIO STONE CO.—Aug. 14th. Capital stock, $100,000; 1,000 shares, $100 each. Trustees: F. Holbrook, J. T. Haley, J. F. Miller, E. T. Steen and W. B. May.

UNITED ANCIENT ORDER OF DRUIDS.—Aug. 18th. Capital stock, $90,000; 1,000 shares, $90 each. Directors: Conrad Berghoefer, Jos. Mayu, S. Lion, Jno. Staude, J. A. Maison, Chas. Kittleburger, A. L. Thiele and G. F. Schafer.

Practical Mining and Milling Processes Described

BEAN'S

HISTORY AND DIRECTORY

—OF—

NEVADA COUNTY,

CALIFORNIA.

Containing a complete History of the County, with Sketches of the various Towns and Mining Camps, the Names and Occupation of Residents; also, full Statistics of Mining and all other Industrial Resources.

Also, description of the Chlorine and other processes; Geological Formation of the most noted mines in California, etc., etc.

COMPILED BY EDWIN F. BEAN.

Editor and Publisher of the Nevada Daily Gazette.

Price, $5—For sale at the office of the Mining and Scientific Press, San Francisco. 13v15tf

---

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Aug. 8th: Mr. Arnold, the Supt. of the Leviathan mine, came into town on Wednesday, bringing samples of finer ore than before struck. Native copper could he seen all through it, even among the white quartz, and one specimen of hlue hlack ore showed under the glass, unmistakahle eilver sulphurets. One peculiarity of the explorations on this mine ie worthy of notice. In looking ahout for a point from which to run the tunnel five years ago, the party then in charge selected a place where a strong spring of sulphur water hroke out, and as it proved, the tunnel wae run all the way in ledge matter. The first appearance of the hlack ore was at ahout 350 feet from the mouth of the tunnel. This ore assayed from $100 to $2,100 per ton, but it was only in the bottom of the tunnel, and the workmen were unable to proceed further at that time, hy reason of a noxious gas which injured the eyes.

Chronicle, Aug. 8th: Supt. Slaven, of the IXL claim, has just completed the re-timhering of the upper tunnel, and has this week heen getting out some very fine ore. The Pitteburg mill will he ready to commence running on this ore on or about the first of Septemher.

Amador County.

Jackson *Ledger*, Aug. 15th: The new oven at the chlorination works of Coney & Bigelow is nearly completed.

"Old Boh's" claim is increasing every day. The vein is now seven feet wide, and the rock is of a numher one quality.

Work has heen resumed on the old Keystone shaft, nnder the snperintendence of Mr. Moore. The shaft has lain idle for a long time, and the labor of freeing it from water will he great.

Calaveras County.

Chronicle, Aug. 15th: Matthews & Co. have succeeded in getting the water out of their claim, and struck gravel which prospects richly.

Inyo County.

The Independence correspondent of the Aurora *Union*, of August 8th, eays: The mines of Cerro Gordo are richer in minerals than any other district it has ever heen my fortune to inspect, and its citizens seem to he intent upon hringing it into shape to make the "one thing needful." Beaudry & De Sermean will have a large furnace in full operation hy the first of next week. Clark & Mattison will have a large reverheratory working upon the Swansea principle, in three weeks. Belshaw & Elder have graded a fair wagon road from the Lake shore to the upper portion of the town of Cerro Gordo, and are engaged in hauling up a steam boiler and engine, with which to drive the fan for a large blast furnace, which they intend to have running as soon as practicahle—say eight weeks. The miners are husily engaged in extracting ore to enahle the furnaces to run as steadily as possihle.

Mariposa County.

Mail, Aug. 14th: We hear that the prospects of Fine, Harhour & Prescott, at their recently opened quartz mine on the Buckingham Mountain, continue to be of the most flattering character, the vein apparently increasing in richness as they descend on it. We understand that they intend having 100 tons of the rock crushed at a neighhoring mill. If the resnlt is as favorahle as at present indicated, the company will, douhtless, erect a mill in close proximity to the mine.

Nevada County.

Transcript, Aug. 12th: The Channel Mining Co., John Schutchess and others, has located 3,000 ft. of ground in the bed of Squirrel Creek, Rough and Ready township, for mining purposes.

Aug. 13th: The Kentucky Blue Gravel Mining Co. is engaged in prospecting for the gravel channel near Moore's Flat. Last winter the pumps were covered and the shafts filled up. A month ago, Harvey Boono took charge as Supt. The shaft has been cleared, and contractors are now engaged in einking the shaft.

We eaw eome eplendid specimen rock from the Rising Star mine, Deer Creek, yeeterday. It was taken out 410 ft. helow the surface, and is completely studded with gold as bright as coin.

Aug. 15th: Wells and others, of Omega, have located 2,000 ft. of mining ground between the Middle and South Fork of Steep Hollow. The claim is opposite and above the mouth of Cedar Ravine.

While digging for the foundation of a huilding at the Banner mine, on Thursday, the workmen discovered a quartz ledge three ft. wide on the croppings. The rock is thickly sprinkled with fine gold, and the ledge looks like a true veiu.

The Kentucky Blue Gravel Co. are at work hydraulicing, and making good wages about 1,000 ft. from where they are sinking from the channel. The ground through which the shaft is now heing sunk is composed of a sort of gravel or cement peculiar to these channele. Recently the ground has changed, and the miners think they are not far from pipe clay. Should the Kentucky Co. succeed, many new enterprises will be started for the purpose of reaching and opening the same channel that they are sinkiug for.

The sulphuret works of A. F. Burr & Co., near Grass Valley, were destroyed by fire on Sunday last. The property was owned hy A. F. Burr and W. W. Hohart, and was valued at $5,000. The works were insured for $3,000.

Gazette, Aug. 15th: We are informed hy G. G. Visit, just down from Diamond Creek, that several hydraulic companies are now carrying on extensive operations. The claims of Kirtly and some others are reported to be paying largely. Water is ahundant, and in consequence of the large amount of snow deposited in the mountain will hold out to a later period than usual. The ownere of the Salathiel quartz mine are running their 10-stamp mill day and night, and the rock is helieved to he payiug cousiderahly more than expenses. A newly discovered ledge, called the Comanche, near the old Union mill, is now heing opened by Slinger and others, who feel confident of developiug a valuahle mine.

Grass Valley *Union*, Aug. 14th: The Empire Co., on Ophir Hill, is preparing a foundation for their new 120-horse power engine which will he used at the hoisting works. In excavating for the foundation a, quartz ledge was struck, which shows free gold. There is no telling how much of the oro there is in that hill.

The Idaho Co. have just completed a run of 200 loads of quartz from their mine, which yielded $8,000—equal to $40 per ton.

Grass Valley *National*, Aug. 13th: We are informed that about 200 loads of rock from the Idaho Co. has heen crushed, from which ahout $8,000 have been realized.

Aug. 17th: C. McCue informs us that 14 loads of rock, taken from the third level of the General Grant mine and crushed at Forest Springs mill, yielded 70¾ ounces of gold.

Excelsior.—Gold Hill *News*, Aug. 12th: The Empire ledge, in Meadow Lake district, Nevada County, Cal., must be a very rich deposit of gold-bearing ore, if we can judge of some specimens of it which have been presented to us by a practical miner, named Ravell, who took them out of the Empire Co's shaft this spring. We have just had an assay made of one of the specimens, by Mr. August Smolz, private assayer of the Yellow Jacket mine in Gold Hill, which certainly reveals a fahnlous amount of wealth in the Empiré ledge, if the quantity of ore of this descriptiou exists to auy extent—of which there is every indication. The specimen assayed was a piece of ore about the size of half an English walnut, of a yellowish color and porous character, and the yield was at the rate of $93,770.97 per tou in gold. There is a good deal going on at Meadow Lake just now; many of the mining companies doing the annual work on their claims, which is required by the local laws of the district; other companies, now that the snow has melted off, are developiug their claims, and penetrating to lower levels; while the mill companies are preparing to start up, and trying to solve the mystery whether the rehellions ores of the district can he overcome.

Virginia *Enterprise*, Aug. 12th: The Mohawk & Montreal Co's mill, at Exceleior, starts up on next Monday, on ore from the famous mine near hy, belonging to the company.

Placer County.

Auhurn *Stars and Stripes*, Aug. 13th: The mine near Ophir, known as the Peter Walter claim, from which large returne have been realized, was sold last week to Walter Van Dyke, of San Francisco. It is reported that Van Dyke paid $10,000 for the entire ledge, and at that price it is considered a good bargain.

The Gold Run correspondent of the Dutch Flat *Enquirer*, of Aug. 15th, says:

Moore, Miner & Co. have again cleaned up from $1,200 to $1,500, after a run of 20 days. This claim has been bothered a great deal with a very hard bottom, so much so that they have been forced to use powder, putting iu small blasts of from 15 to 40 kegs iu their hard bottom, to heave it up, and loosen it so that they may be able to wash it away faster and easier with the pipes.

Plumas County.

Quincy *National*, Aug. 18th: The Greenville correspondent writes: An opening was made to-day in the Indian Valley mine between the lower tunnel aud the shaft. This will he a great advantage to the mill, saving over 100 feet in hoisting, and running the rock directly into the mill, instead of into the dump-house, as at present, hesides opening an immense amount of ground for stoping. Both the mills belonging to this mine are running steadily and paying well. The New York mill intends to commence operations in a few days.

San Bernardino County.

Guardian, Aug. 8th: The mining interests of Lytle Creek are ahout to receive an additional impetus by the construction of some important works hy Harpending & Co., under the superintendence of Captain Winder. This company will soon commence work on a flume, capahle of containing 600 inches of water, that will tap the creek about three miles ahove Texas point, and be conducted thence to the desired elevation for sluicing and hydraulic purposes. Several of the miners on the creek are doing well. A party of Frenchmen are averaging $40 per day. Two young men prospecting lately made $13 in oue day, and of the surface dirt. They auticipate a good thing when the gravel is reached. That we hear no complaint from the miners of that section, is a very good indication that they are making fair living wages, if not doing even better.

Sierra County.

Downieville *Messenger*, Aug. 15th: Sol. Babb & Co., of Mohawk Valley, have just got water into their diggings, and are reported as doing well.

Dadd & Co., working in Mohawk Valley, just above Bahh & Co., picked up recently a piece of gold weighing four ounces.

Wilhurn, McClelland, Coulson & Miller, found recently in their claims at Mohawk, a specimen containing 20 ozs. of gold.

Siskiyou County.

Yreka *Union*, Aug. 15th: The Scott's Bar correspondent says: The *Cheval Mort* (dead horse) claim, is doing well. It is reported that the top ground has paid $2 per day to the hand from the commencement....The owners of the "Quartzy," Poor Man's Bar, are on the pitch of the rock, and expect, ere long, to strike it hig. Pullin & Co. are rapidly descending toward the bedrock; and Chinese Lone, on the same har, is moving his rigging upon the ground that paid him so well last summer. The wing-dams of Magoffey & Co., Rogers & Co., and those of the different Chinese companies, are all completed, and they aro now pegging away to reach the hedrock. The Ramhoo is progressing splendidly.

Tulare County.

Visalia *Delta*, Aug. 12th: The White River correspondent writes: Mining is progressing slowly at present, there are ouly two parties engaged in taking out quartz. A. J. Maltby is taking out some very rich rock.

The Kernville correspondent writes: Twenty feet from the main shaft, the ledge of the Kern River Co. is five feet thick, and the ore is of excellent quality. All the ore taken from the main shaft and the levels uow heing run, contained $30 per ton. Mr. Wadleigh, Supt. of the Lady Bell mine, informed me that the ore taken out of their new level yielded $100 per foot for every foot they had advanced along the vein.... Ellsworth & Co's mill is now running. It is a 16-stamp mill, and is capahle of crushing 20 tons of ore per day. The mill is supplied with one of Blake's rock-crushers, which keeps the mill going with ease, requiring hut one man to attend it.

Tuolumne County.

Sonora *Democrat*, Aug. 7th: Lucas & Paige have etruck it again in their tunnel and shaft just completed, in the Sultan mine at Springfield. A friend informs us that he saw those gentlemen pounding dccomposed rock, that actually yielded cakes of solid gold, as it came from the mortar.

The Columbia correspondent says: N. B. Green has sold hie quartz vein and gone to the Bay to reside.

Mr. Hiskey's machinery for his quartz mine at American Camp, has partly arrived in this city. He and his partners, Meinhart and Morton, are making extensive preparations to prosecute the work ou the mine. The Grant vein, near the Star mine, will soon he opened again.

COLORADO.

Central City *Register*, July 30th: The high water is interrupting mining operations very extensively, especially in the creeks and on the hare. Iu some instauces har and gulch mining have been stopped entirely. A silver lode has just beeu discovered in Morris District, near Downieville, which promises to rival the largest and richest around Georgetown. It is represented as being quite a large vein, and the surface ore is very rich. A sample tested yesterday gave $993 52 in silver per ton. Messrs. Lowe, of Idaho, and Snyder and others, of Mill City, own it.

A silver ingot weighing 175 pounds came down from Georgetown yesterday.

The Johnson lode has a shaft down soms 30 ft., with ahout a foot of fine looking eurface quartz. Scveral lots of this quartz have been run in arastras, and yielded $240 per cord in gold. The ore carries nearly as much eilver as it does of gold, very little of which is saved in arastras. The Washington, Tom Coleman, Nugget and Jos Mayland are all supposed to he the eams crevice as the Johnson. All show ahout the same width of crevice, same pay quartz, and ahout the same characteristics generally, which are those of a very strong, rich, main vein.

Central City *Herald*, July 29th: Considerahle prospecting is being done on Gunnel Hill. Mr. Wallace Wightman, has made a new discovery north of the Masonic hurying ground, which causes a great deal of excitement....The gold shipment this week, thus far, has been very light. This morning's shipment amounted to $25,880, currency valnation; of this amount the Rocky Mountain National Bank shipped 834 ounces, and Warren, Hussey & Co., 490 ouuces....R. J. White, last evening, cleaned up from his claims, on Russell gulch, a nugget that weighs 500 pennyweights....Sanderson & Co. have started up on the Wilhur lode, Central City district. It is their intention to run their claims night and day....The Pleasant Valley G. M. Co's gulch claims are panning out well. This morning Mr. Owens showed us a nugget, which they cleaned up yesterday, that weighs over two ounces....Hank Neikerk, from Sugar Loaf District, Boulder county, informs us that he is still prosecuting work on the U. S. Bank lode. He says there is but little work goiug on in James Creek. John Virden is running two arastras on surface quartz, which is yieldiug from $80 to $100 per cord.

OREGON.

Jacksonville *Sentinel*, August 8th: Funck & Cummins are having rock drawn from their lead, on the left hand fork of Jackson Creek, to the Occidental Mill, which commenced crushing yesterday.

The Walla Walla *Statesman* says: Mr. W. F. Jones, of Walla Walla, has left with us several specimens of gold bearing quartz, taken from a ledge which he discovered on Burnt River, a short time since. The epecimens are quite rich, and indicate an important discovery.

Dalles *Mountaineer*, Aug. 7th: On the 2d day of July, Hastings, Oshorn and Frishy left this city on a prospecting tour for gold mines in the Cascade range, north of the Columbia river. They prospected White Salmon and all the small streams in the neighborhood of Mts. Adame and St. Helens. The result of this trip has eatisfied the parties that the country contains gold-bearing quartz, bnt they were unahle to find any indications of placer mines.

The news from Elk, Olive, Granite and Burnt River is unimportant. Considerable excitement is manifested in reference to the new diggings on the head of Burnt River, which is destined to be a camp of considerahle importance. Granite and Olive are yielding fair wages, but will soon he owned and controlled by Chinamen. At Elk the only feature of interest is quartz. McQnade & Co. will commence crushing in a few days, which will test the value of the rock in that camp.

Nothing definite is yet known in relation to the Malheur and Stein's mountain diggings.

DACOTAH.

The Central City (Colorado) *Register* of Aug. 8th, says: The paper etarted in the new mines known as the Sweetwater Mines is defunct. The mines themselves will soon be abandoned unless something is discovered.

IDAHO.

Owyhee *Avalanche*, August 8th: This week, we took a trip among the mines, and found increased evidence of prosperity. Everywhere we noticed preparatione actively going on for extensive miniug operations, which have commenced and will continue without interruption during the coming winter.

Mr. Shiveley has commenced work on the Boomerang, and besides prospecting it, ho will take out ore for milling purposes. A number of cuts have been run across the ledge, and two shafts sunk to a depth of about 12 feet. In some places the quartz shows a width of from four to six feet. Some of the surface rock shown us was literally sprinkled with gold.

The Ida Elmore mine continuee to keep

e Lincoln mill in operation. Large nounts of bullion are turned out.

Rich gold bearing quartz has again been ruck in the south drift of the Woodstock, 10 feet from the surface. A contract has ›en let for running a drift 60 feet south om the bottom of the north shaft. Work also progressing in the north drift. mith's arastra at Ruby is now running on Voodstock ore.

Mose Lyon and party have discovered a ammoth quartz ledge, three or four miles › the northeast of Wagontown. It is said › be from 12 to 18 feet wide, and traceable ›r two miles. They have christened it the Avalanche," and have brought in some of ıo rock for the purpose of getting it assayed.

Extensive improvements have been made n the Golden Chariot during the past ionth. The Upper Sinker mill is now runing on Golden Chariot ore, and will continue to do so all summer.

Peck & Porter are vigorously pushing ›rward work on the second extension of ıe Oro Fino. A shaft is being sunk on ıe ledge, which is from 18 inches to two ›et in width, and yields a good quality of ıilling ore. Quite a large amount of quartz ıs already been taken out.

The Oro Fino will soon be in proper ıape for taking out heaps of ore. The ſorning Star whistle will soon be heard ;ain.

The Webfoot mill has been thoroughly ›paired, and put in good working order. he mill will commence working Woodock ore in a day or two.

Work is still rapidly progressing on the ilenbrook mine. We noticed on the dump larga pile of good-looking ore, which will e worked in a few days.

MONTANA.

Helena *Post*, August 7th: A large gold rick, weighing 962 ozs., and worth $17,-51.24 in coin, was smelted by Mr. F. Bohm esterday, and shipped East on Wells, argo & Co's stage.

At the assay office of Mr. F. Bohm there as smelted yesterday gold dust of the value f $13,000, coin. The largest bar had a oin value of $5,000.

Considerable money is being taken out at iegan. On Wednesday last, the Piegan ›itch and Water Co. cleaned up 100 ounces fter a run of two weeks with from seven to ight men working on bedrock. Their lean up before this last, resulted in 200 ozs. f gold after a three weeks' run. Still bet›r results are expected, as the mines inrease in richness the further they are fol›wed up the gulch.

The new Basin Gulch diggings in Boulder Valley, are proving more extensive than was t first supposed. As far up as claim 31 bove discovery, the ground is found to ay, on an average, five cents to the pan, nd on No. 34 below discovery, nine feet of ravel pays from eight to ten cents to the an. The claim below discovery containg 600 feet, was sold one week ago for 1,500. It is reported that $15 has been bt ained from one pan of dirt taken from edrock in claim No. 1 in the Eureka disrict. D. L. Lewis gives us the following ems: Williams & Co. are working to a disdvantage at present, but are making about 11 per day to the man. Lewis & Co. are ngaged in running a drain ditch and obaining excellent prospects. It is thought hat, for a distance of three to five miles, the round is equally as good as that of Last Chance Gulch below No. 8. The gold is venly distributed and very fine. Claims re selling generally at from $200 to $500.

The gulch upon which Helena is situated, s by no means worked out. Not only are Messrs. Taylor, Tompson & Co. making normous runs, but other parties are doing ell. Messrs. Baker & Brisbee, with 35 ien, are cleaning up about 100 ounces per eek. C. B. Hunt's claim took out 38 ozs. f gold for the week ending on Saturday ight last. They had 10 men at work dur›g the week. One-half of the Union Co's ulch claim, consisting of 700 ft., and situ›ed one mile below the ground of Messrs. Taylor, Thompson & Co., was sold to Chinaen last week for $6,000. The project for utting a bedrock flume in Last Chance ulch will be revived as soon as Col. Truett eturns.

Fears are entertained that the results anicipated from the Poor Man's Joy lead cannot this season be realized. A close examnation of the ore shows that it contains rom five to ten per cent. of lead, besides a arge quantity of copper, arsenic and antiıony, and it is thought that the presence of he base metals in such proportions may so nterfere with the process of amalgamation, hat it may become necessary to send to the States for the latest improved and expenive machinery.

The mill of the St. Louis & Montana Co. t Phillipsburg, cleaned up $3,000 in bullion on Friday last, the result of a run upon 30 tons of rock from the Hope lead. Three hundred tons of a similar quality is already on the ground, and will soon be crushed. Work upon the Rumley & Bugher ledge is being actively prosecuted.

Many of the stampeders are returning from Wilson's Creek, and Basin and Galena Gulches, and more work is being done at Radersburg than for some time before. The opening of claims on Badger Bar and Bay Horse Hill is actively progressing. McBride & Co. about 10 days ago, cleaned up $1,500 from the first mentioned mines, after a run of 10 days with one hydraulic. Charity Gulch is paying well. A new bar was struck a few days since in Blacker's Gulch, which is paying better than any mine yet discovered at the Radersberg Camp. The gold is generally coarse, and nuggets weighing $2.50 are found.

The right hand fork of Dry Gulch is being energetically worked throughout its entire length and good pay is being obtained. ....On Big Indian Gulch the number of claims worked is limited, but the few which are being mined are yielding well. Quartz mining at the head of the gulch is being actively prosecuted....Tucker Gulch is paying well so far as worked....In Clark's Gulch a gang of Chinamen are making good wages with rockers. Parties working near them are obtaining from $4 to $6 per day by the same method of working.

The Deer Lodge *Independent* says: A 22-ounce boulder, containing about $325 in gold, was taken out near Silver Bow recently....Recent developments show that the Pioneer and Gold Creek diggings are much more extensive than at first supposed. Rich mines have been struck in two places, two or three miles this side of the main Pioneer Gulch, which promise as large a yield as any of the ground yet worked in that vicinity....Silver Bow is paying better than ever before. Donovan & Driscoll are ground-sluicing an extensive bar, at the lower end of the mines. A large area of mining ground below the town will pay from $4 to $8 per day to the hand. The mines of Smith, Simpson & Nuvenbury, near Silver Bow, are paying about $18 per day to the man. The Prairie diggings, pay good wages, in some instances as high as $50 per day to the man. The gulch below is yielding from $18 to $20 per day, with a scarcity of water.

NEVADA.

Esmeralda.

Aurora *Union*, August 8th: Forty-five hundred pounds of rock, from the Pacific, was brought to town and worked this week, yielding over $400.

Humboldt.

Winnemucca *Argent*, August 13th: J. M. White brought 2,508 ounces of ore from the Goleonda mine, for shipment, on Saturday last. Mr. White presented us with 8 rich specimens from the Goleonda, which are true representatives of the various kinds of ore now coming from the mine. No. 1 is nearly regulus—probably 85 per cent. metal, color dark, and piece somewhat porous. Nos. 2 and 3 are similar, having heavy black mineral, some of which is nearly like powder and soot, with a red ocherous substance in strata. These pieces are about 75 per cent. metal. Nos. 4 and 5 bear the same general features. They are of a light yellow color, tinged with green, and are of much less density and more crumbly nature. No. 6 is composed of black sulphurets intermingled in a mass of soft, grainless clay, which is solidified by exposure to the atmosphere. The tallowy stuff is precisely the same as that obtained from the famous Poorman of Owyhee. Specimens 7 and 8 combine substances described in the others.

A private letter, dated Orena, August 5th, says: Montezuma smelting works, together with the entire Montezuma mine, sold some time since by the Trinity & Sacramento Mining Co., were turned over to the new proprietors, the Montezuma Mining Company, on the 1st instant. Furnaces are working splendidly—never did better work.

Reese River.

Austin *Reveille*, August 7th: There is no longer any doubt that the mines of Treasure Hill, in the district of White Pine, are situated in Lander county.

Yesterday afternoon, some 3,000 ounces of bullion were brought into the city from Rigby's mill, in the district of San Antonio.

August 11th: Since the repairs were completed on the Manhattan mill, about the first of the present month, it has been employed in reducing various lots of ore from Lauder Hill and the district of White Pine. The lots are generally small, but of a very high grade of ore. It may be fairly doubted if there ever was a mill before that worked such a variety of ore in so many different lots as the Manhattan does each month.

The sixteen bars of bullion, which were brought into this city from the district of White Pine on Saturday, formed as handsome a lot as we had seen for many a day. The bars ranged from .885 to .944 fine, and their total value was $21,360.21. They were produced at the Centenary mill, in the district of Newark, and were mainly from ore obtained from the Eberhardt South on Treasure Hill, in White Pine. The bullion was shipped through the banking house of John A. Paxton & Co.

August 12th: This morning, a small lot of 700 ounces of bullion were brought into the city from the district of Washington. We believe it is the first product of the mill of the Utica and Herkimer Co., recently completed in that district.

August 14th: A private letter from the district of White Pine gives information of a rich strike in a claim called the Blue Bell, situated above, but near the famous Keystone and Eberhardt South. The ore is said to be very rich, and equal to that produced by either of the above. The Blue Bell belongs to some of the owners of the Keystone.

The *Mountain Champion*, of Belmont, has learned that the mill of the Silver Peak and Red Mountain Co. was running successfully, and that a large shipment of bullion, valued at $100,000, would soon be made. Clayton's improved crusher, which forms a part of the battery of the mill, is pronounced to be a complete success.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Aug. 12th: The mills about Silver City, many of which have been for sometime lying idle, are again starting up, and the town is beginning to assume quite a brisk appearance. Uncle Joe. Trench's fine large mill, at the lower end of town, resumed crushing day before yesterday, working ore from the Savage mine. This mill alone will give employment to quite a number of men. The company working the Twin mine, at the upper end of the town, are sinking three shafts upon the lead, and at one of these are preparing to erect hoisting works, the engine and much of the machinery for which is now on the ground. The company are employing 20 or 30 men about the mine, and are taking out 10 to 15 tons of ore per day that will yield from $50 to $60 per ton.

The new Sierra Nevada 20-stamp mill will, as we are informed by Mr. Robert Apple, the Superintendent, be completed this week, and will start up next Monday on ore from the mine of the company. They now have out upon their dump, to commence with, some 2,000 tons of ore, which it is thought will at least pay $25 or $30 per ton. Mr. Apple is quite confident that he can mine and crush this ore at a cost not exceeding $2 per ton.

Aug. 14th: The total shipment of bullion for the past week from this city and Gold Hill, was 7,094 pounds, worth $192,466.67.

Gold Hill *News*, Aug. 11th: Baldwin district, west of Walker Lake, contains some very promising ledges, apparently rich in the precious metals, some of the ore assaying as high as $900 to the ton in silver and gold—principally silver. It also contains a sufficient quantity of lead to flux it and make it work easy.

The Savage Co. have struck a very promising deposit in their sixth level, in which they find a considerable amount of milling ore. Although the great mass of the ore is of a grade too low to pay for milling at the present cost, it is hoped that it may grow richer as it is further developed. It is about 100 feet further north than where they have lately had any ore in the mine; therefore it is looked upon as a very promising indication.

August 12th: The Imperial Consolidated Mining Co. this morning dispatched a company of workmen out to their mine in New Truckee district, 65 miles east of Virginia City, to commence taking out some of their rich argentiferous galena ore, preparatory to having it transported over the railroad to Reno, and from thence hauled to the smelting works at Galena, Washoe County.

There was shipped from Wells, Fargo & Co's Gold Hill office this morning, 10 sacks of bullion, weighing 775 pounds, and of the assayed value of $18,932 43.

The Gold Hill Branch assay office of E. Ruhling & Co. received this morning for melting and assay, 2,605 ounces of crude bullion.

C. Wiegand & Co., of Gold Hill, received this morning for melting and assay, 2,321 ounces of crude bullion.

The Pacific Union Express shipped last night ten bars of bullion, valued at $18,-714 99.

WASHINGTON.

The Olympic *Transcript* says: The beach mines at Gray's Harbor are now being worked profitably. They yield $5 a day with a Long Tom. Wells sunk some distance back from the beach show that pay is generally distributed through the surrounding country. Our informant intends to prospect in the neighborhood, and if the reports are verified, will erect machinery such as is used in Gold Bluff, California.

The Wine Interest of California.

[The following article is forwarded to us by a writer who has the interest represented at heart, and who is also familiar with the process mentioned for its great improvement and speedy advancement.]

To raise the wine industry of California to what its climate destines it to be—the first wine-growing country on this continent—as it has been plausibly represented, requires a radical reform, as well in the mode of working the wine, as the entire system observed. As long as we have to store wine for two, three or more years, till ripe and saleable, we cannot compete with other wine countries, however pure and good our product may be. "Quick sales and ready profits" is the watchword in all industry. The present mode of fermenting the wine, by exclusion of air, does not permit it; that mode, violating nature's plainest directions, has had its days, though they numbered two thousands of years. It has been proved now, and everybody can demonstrate it for himself, that fermentation is an oxidation process, requiring the oxygen of the atmosphere applied to every part of the substance to be thorough and complete. Therefore, the adoption of the mode of impelling air into the fermenting substance—patented by R. d'Heureuse, of San Francisco, August 6th, 1867—is an absolute necessity for all wine-makers. By it the wine obtains, with a speedy and perfect fermentation, full stability and ripeness in a few weeks after it is made, is free from all earthy taste, and ready for shipment to any part of the world the same season it is made.

But this alone, though essential for profitable wine manufacture, is not sufficient. As in all other industries, the manufacture should be a separate branch, independent of the grape-growers, from whom the grapes should be purchased by manufacturing establishments of sufficient capacity in all grape-growing districts. The wine and brandy will be thus obtained more economically, and, under proper direction, superior to that done more expensively in small lots.

This rule of division of labor alone has given satisfaction in all other branches of industry, and is finding its way also in the wine districts of Europe. California cannot do without it. The force of the argument has been admitted by reflecting men of this and other States. No time should be lost in the formation of companies, with capital, for the purpose of erecting proper establishments for wine and brandy-making in the various wine districts, to contract for the purchase of grapes and sale of their product, which are readily taken by the best wine-dealers, if properly air-treated in the manner indicated. Fifty per cent. and above, on the money invested, it is claimed, will be the profits of a few months' work. All these hundreds of small vineyards, now rather a loss than otherwise to their owners, might become profitable to them, if they confine themselves to the sale of their grapes at 75 cents or $1 per 100 lbs.; and thousands of others to be planted will rapidly increase the common wealth of the State, giving happy homes to thousands of industrious husbandmen. Wine is the only bulky product of manufacture which in this State will find constantly a market in unlimited quantities, with fair profit to all concerned. Properly promoted in the direction indicated, the annual wine production in a few years will exceed the value of the production even of the precious metals of California in her palmiest days.

Wine-growers, and all those interested in the prosperity of this country, and those looking for safe, profitable investment in industrial, not merely speculative pursuits (for honest industry ceases where wily speculation steps in), should lose no time in acting on this suggestion.

BULLION BRIDLE.—A bridle was received at the Exhibition to-day, which is made of silver bullion, weighing four pounds, and which cost $550. It was made for Col. Curry, of Carson City, and was intended for a present to President Lincoln, before the news arrived of his assassination, but was then presented to a citizen of San José.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.- Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

Notice.—The partnership of C. W. M. Smith, W. B. Ewer and A. T. Dewey, has been dissolved this day by mutual consent. The Patent Agency and Newspaper Business of the MINING AND SCIENTIFIC PRESS will be continued under the firm-name of Dewey & Co., by A. T. Dewey and W. B Ewer.
San Francisco, August 1, 1868.

San Francisco:

Saturday Morning, Aug. 22, 1868

Notices to Correspondents.

HÆMATITE, Downieville.—The discovery of fossil, of carboniferous age, said to have been found amidst the celebrated hæmatite ore deposits of High Furness, Lancashire, England, from which such enormous quantities of Bessemer steel are now being annually made, has recently been disputed. Mr. J. P. Morris, in "The Furness, Cartmel and Grange Visitor," publishes a very elaborate paper on the subject, in which, as far as we can perceive, he utterly demolishes the theory first put forth by Mr. E. W. Binney, that of certain lithological specimens, one was a *Stigmaria*, and the other a Lepidodendron; the theory being that "these plants must have floated in with the water which brought the iron, or else they must have fallen into the cavities when such were open at the top, and the iron was in a soft state." Mr. Morris has very satisfactorily shown that the deposit (at Water Blain, where these supposed fossils were found,) is of silurian, not carboniferous age—a fact strongly corroborated by the circumstance that, like silurian deposits of hæmatite in other parts of England, the one at Water Blain contains a considerable amount of silica, which substance is only found in very small amounts in the ores lying in the carboniferous or mountain limestone. Mr. Morris has shown that the presumed fossils have in no case been found horizontally placed, but always vertically or approaching thereto, notwithstanding they are deposited in an evidently aqueously-formed bed. Mr. Morris pretty clearly establishes the point that the supposed vegetable fossils were *fulgurites*, commonly called thunderbolts, similar to those described by Sir G. Duncan Gibb, Bart., in the "Geologist" for May, 1859, in a paper entitled "A Chapter on Fossil Lightning." It is to be regretted that Mr. Binney should have somewhat tarnished his justly high general reputation as a geologist, and especially so upon subjects relating to the carboniferous period, by hastily adopting a theory respecting the fossils in question on what we are bound to consider as insufficient evidence after carefully perusing Mr. Morris' paper.

ADAMANT, SIERRA CO.—The cause of the variety of hardness found as a property of different bodies, is not well understood. Even in the same substance very trifling variations in the external circumstances to which the body is subjected often produce extraordinary differences in the degree of hardness which it exhibits—the difference of hardness occasioned by the slow or rapid cooling of steel is an instance illustrative of the fact just named, which is familiar to almost every one; still greater, however, is the variation which occurs in the case of carbon in its three well known forms, of charcoal, graphite and diamond.

Eclipse of the Sun.

The most important total eclipse of the sun which has ever taken place, in any age, occurred on Tuesday; invisible, however, on this hemisphere. From a peculiar coincidence of favorable circumstances, the duration of the total eclipse will be prolonged nearly seven minutes—6m. 50s.—a longer time than the sun has been obscured by an eclipse for the last three or four thousand years, and longer than any which can occur so far as eclipses have been calculated for the future—about 400 years.

Great preparations have been made to render the observations connected with this eclipse as perfect as possible. One of the most important points which it is hoped may be elucidated, is the cause of the hitherto inexplicable perturbations of the planet Mercury. It has been suggested that these disturbances are caused by an undiscovered planet inside of the orbit of Mercury. But no opportunity has yet occurred for a thorough search within that astronomical field, on account of its nearness to the sun, and the constant brilliancy of that luminary. It is hoped the present eclipse will afford the opportunity for a thorough search for this supposed planet.

The shadow of the moon will first reach the earth upon the little island of Perim, at the entrance of the Red Sea; passing thence southwestwardly, the eclipse will be total at the port of Aden, on the Arabian coast, from whence its track will cross the Arabian Sea, the southern portion of Hindostan, the peninsula of Siam, the islands of Borneo, Celebez, and finally vanish away upon the island of New Guinea. The moons shadow will sweep over a stretch of some 3,000 miles in length, by a breadth of about 30 miles.

CALIFORNIA PAPER MANUFACTURE.—S. P. Taylor & Co. display a very fine assortment of paper manufactured at the Pioneer Paper Mills, Taylorville, Marin county, which is a decided credit to the State. The assortment consists of hook, news, blue, yellow, pink and green printing paper, and Manila wrapping paper of an excellent quality from the largest to the smallest size. These mills have been in operation twelve years, showing conclusively that paper *can* be manufactured on this coast, notwithstanding the strong competition naturally met with from importations. To-day many of their goods are sought for in preference to Eastern. Messrs. Taylor & Co., as agents, also exhibit a first class straw wrapping paper from the San Lorenzo Mills, Santa Cruz.

We are pleased to learn that there is in course of erection, in this State, two other mills: one at Point Arenas, Mendocino county, which will soon be ready to start; the other at Saratoga, near San José. Another mill is also about ready to start in Oregon. It is probable, when all these mills are in operation, we will, for the most part, be independent of other markets for this staple. There is an abundance of raw material to be had cheaper than in New York, and the vast quantities of rags sent there will find a market at home, and will contribute largely to our wealth, manufacturing interests and independence. Home manufactories of such a class should receive preference by all consumers. It is the true method of bringing down prices.

THE PACIFIC ELASTIC SPONGE COMPANY. We would call attention to the advertisement of the Elastic Sponge Co., which will be found in another column. After a trial of over four months on this coast, it appears that all articles made of that material are giving universal satisfaction. For cleanliness, purity, and cheapness, it cannot be equaled or excelled by any material now in use; and we are happy to know that the success of the company is gratifying, while their trade is rapidly increasing. To all visiting the Mechanics' Fair, we would suggest that they should by all means take a look at the exhibition made by this company, and there witness the truly delicious articles of upholstery manufactured from elastic sponge.

PATRONIZE HOME MANUFACTURES. — Scarcely any Californian who visits the Fair, but feels some pride at the really surprising exhibition of the products of our local factories. If everybody who thus glories in the progress of the State, and considers it something to be a Californian, would patronize our home manufactures, this progress would be greatly accelerated. Capitalists, artists, inventors, and workmen, as a matter of course are pleased when a discriminating public approve of their work; but such approbation is of little value as an inducement for the investment of capital and skill, unless it be accompanied by the solid benefit of business. Manufacturers want customers to buy their goods. The exhibition at the Fair derives its chief attraction from the enterprise of manufacturers displaying their goods, for the purpose of securing customers—the Fair being really a large and effective advertising medium. If manufacturers be a benefit to the State, it is the duty of the citizens to patronize them. It is not a wise economy that starves the local manufacturers, or dwarfs their operations, because imported goods of a similar character can be purchased for a few cents or a dollar or two less. Enterprise were impossible under such a system.

There are some persons who argue that it is extravagant to consume expensive articles of clothing, furniture, etc. Such an argument is true, if the poor, to keep up appearances, run in debt for such purpose; but it is false and pernicious when applied to the wealthy. The rich cannot better distribute their surplus cash than by encouraging design and skill in the working classes. Money thus expended is far better applied than if it were devoted to a society to sustain the families of the workmen in idleness.

If the wealthy classes of San Francisco were to purchase every article of local manufacture on exhibition, and use them up, the money thus invested would return a greater interest, in the way of encouraging immigration, and increased value of real estate, than if loaned at one per cent. per month.

CAUSE FOR CONGRATULATION.—We are not of those who think "self praise is no recommendation." We believe that those who have ability, should let the world know it. One of the chief causes why mediocrity so often distances merit, in the race for riches, is because merit is generally too modest—"hiding its light under the bushel" of self-conscious superiority. We see no reason why the people of California—a State so young in manufacturing industry as to be scarcely recognized by the world in that connection,—should not congratulate themselves at their success in competing with the older countries in the manufacture of a great many of the most important articles required by themselves. It is something to feel honestly proud of, to see so many medals won in foreign fields, appended to articles made and designed in California. We do not think much of the citizen of the State who does not feel at least a tinge of pride to know that California manufacturers won prizes at the World's Fairs in England and France, in departments most hotly contested by the manufacturers of the whole world! If our State has achieved such distinction, despite the tremendous obstacles of high wages, scarcity of skilled workmen, and opposition of importers, what may it not accomplish when such obstacles shall be removed? The display of home manufactured goods at the present Fair, is the best answer we can give to such a query. This display we consider such as to furnish cause for congratulations to every Californian.

A LARGE FILE.—The Pacific File Factory has a case of files on exhibition, and also a variety of reaper and mower sections, which speak well for the skill of the proprietors. Among the former is a file of mammoth proportions, represented to be as large as any other in the world, made for practical use. A very large amount of business is done by this establishment in recutting old files, by which process they are made as good as new, with a saving of nearly fifty per cent. Give them a call at No. 53 Beale street.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

[From the Mechanics' Fair Daily Press.]

Things Here and There at the Fair.

As your regular reporters of the conditien of things at the Fair, now going on with such success in our city, continue to give general reports of the marvellous things to be seen on exhibition, it will only be necessary for me, on this occasion, to allude to a few of the evidences of mechanical skill and improvement to be found in that vast collection of rare articles, that have been brought to my immediate attention.

The show of agricultural and horticultural productions is very meager—a few simply, of dairy products, of choice fruits and flowers; one or two pretty little models of ornamental gardens—constitute the principal features in this department. But this is not intended as an exhibition of the products of the earth, so much as an exhibition of the mechanical skill of our young and growing State.

But the show of mechanical farm implements is very creditable. There are, besides that real curiosity, the Steam Plow, which, by the way, had not a very fair chance to display its powers and advantages in the hard packed soil in which its experiments were made outside the Fair Building, various other plows claiming public attention.

Among these we noticed the Sweepstake Gang Plow, which claims superiority by reason of its simplicity of construction, rendering it little liable to get out of order; by its rising square out of the ground, retaining the same relative position as when in the ground; by the small weight to be raised, and the small power required to raise it; by its ready capability of adjustment to the required depth of plowing; and by its portability. It will plow from two to ten inches deep, and do better work than single plows. Extra parts can be obtained at the factory at any time. The draft is very light, and any boy of *ten* can readily plow with it.

There are several other gang plows that appear to be worthy of attention, among which we may mention that of J. & J. Ingham, of San José, a California invention. [We may here add that this plow will be illustrated in a few days.—EDS. PRESS.]

The Buckeye Mower, Reaper, and Self-Raker, attracts deserved attention. These machines have been long and successfully in operation, and have, we believe, been lately improved, so as to make them still more acceptable to the farmer. They are great labor-saving implements.

The American Spring Bed seems to be quite an improvement on the old style of bedsteads. So, also, the Elastic Sponge Bed—a new application of the sponge to domestic purposes. It seems a decided improvement on beds made of hair, pulu or feathers.

But all these things must be examined to be understood.

Prevost's cocoonery commands, as it deserves, universal attention. Silk is destined to be one of the staple products of California. AGRICOLA.

A NEAT IMPROVEMENT IN DESKS.—We noticed in the Fair, a combined book-case and desk, built by Johnson & Best, cabinet makers, 717 Market street, which in some respects is a decided improvement in this class of manufactures.

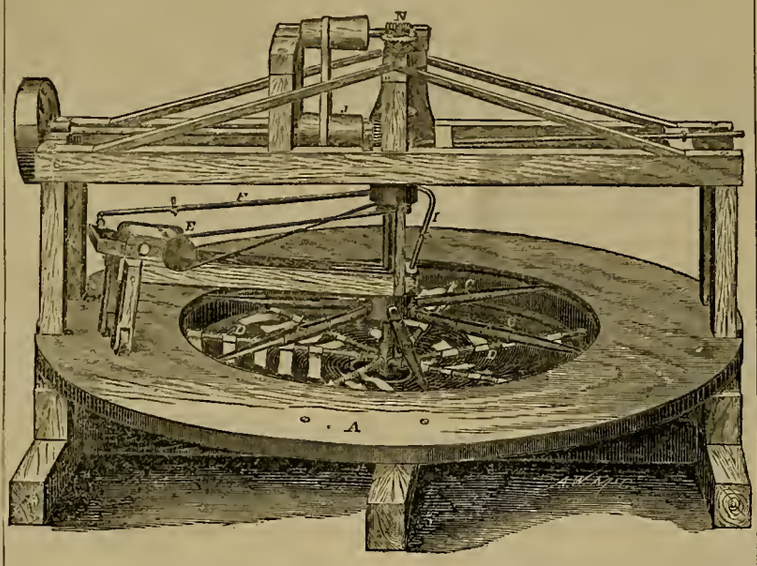
It will be impossible in the absence of a wood-cut, to set forth the advantages of this new style over those in ordinary use, so as to make them clear to the reader; but any interested should ask for the key and examine it for themselves.

There is a triple movement, caused by pulling out the drawer in the center, which forms the desk used for writing, at the same time rolling back the top of the drawer to be out of the way, and turning down by the same operation the door of the smaller drawers or pigeon-holes, leaving them open, and immediately in front of the writer.

This secretary is eleven feet in hight by six feet or more in width, made of black walnut, finely finished, and is an object worthy of notice aside from the valuable improvement we have attempted to describe.

REMOVAL.—Our friends will please bear in mind that the MINING AND SCIENTIFIC PRESS Office, Patent Agency and Job Printing Office has been removed from 505 to 414 Clay street, about half a block below Sansome.

[From the Mechanics' Fair Daily Press.]



Institute Meetings for Discussion.

It was proposed some time ago—and the matter has been duly considered and determined upon—that semi-monthly or monthly meetings for the discussion of subjects touching the mechanical, mining and kindred interests of this coast, should be commenced under the auspices of the Mechanics' Institute, and kept up as a tangible working attachment to that institution which will tend to render its usefulness more particularly effective, as well as general to the Pacific States—in a manner similar to the stated public meetings for discussion which have risen to national importance, under the auspices of the American Institute. Mines and mining machinery will naturally take a leading position amongst the subjects which will recur frequently for discussion; and those who have been engaged in mining personally, or are interested in hearing comparisons made as to the economy or efficiency of different methods and means in mining practice, or in the discussions which will follow freely thereupon between persons who are practically posted, will render Mr. Hallidie and the live men of the Institute all the assistance in their power toward making these meetings one of the features of the public life of this metropolis. Our bronzed and horny-handed acquaintances from the mining districts of the foothills, as well as from Nevada, Arizona, British Columbia and Idaho, who come to town always with beaming eyes, and a wholesome manliness in their behavior, will "let up" on the theaters when the Institute meets, and will drop in and compare notes with others of the same stamp, who are fortunate enough to possess ideas. Metallurgy, agriculture, wine-making, etc., will not be beyond the scope of these meetings. The benefits that may result from the inauguration of such an "institution" to keep sight of our peculiar interests, cannot be over-estimated. The right men are now wanted to come up and assist. Owing to the great amount of work and care on hand in connection with the Exhibition, the commencement of the meetings has been deferred till the close of the Fair, when further notice of the matter may be expected through the newspapers.

ADDITIONAL ENTRIES.—About twenty articles a day, on an average, are now admitted at the side door, for exhibition merely, and gladly received, but they are not entered for competition or premium. The principal bother now, says the Entry Clerk, is about getting little articles out, which is frequently desired for temporary purposes, and there is always difficulty when they have not been entered *pro forma*. On Monday, Tuesday and Wednesday of this week, the following noteworthy entries were made: A glass case of paints and oils of California manufactnre, by Mr. Terryn; a new kind of velocipede of California invention, by Chas. A. Way; a "fertilizing tube" for the application of fluid manure to roots at a little depth; California salt, by Holliday & Brenham; an equilibrium steam engine, by Mr. Wells; samples of California olive oil, by E. Louis; Mrs. Curtis' improved method of cutting dresses, by Mrs. Barringer; an improved railway car, to prevent accidents on railways, by Dr. Beers; some Circassian dog-hair overcoats, from Alaska, by Wm. Clayton; Kellum's spiral buggy springs; monitor safes, by Jonathan Kittredge; glass case of copper ores, from Planet mine, Arizona, by Mr. Baldwin; a combined swimming apparatus and life-preserver, by Mr. Olsen; a concealed door spring, and reversed joint butt, by the Barker Spring and Butt Company; a gear drill, by Alfred Swingle; a buggy with detachment to prevent horses from running away, by Mr. Moore; a hullian bridle, by Mr. Beatty; samples of tweeds, wineys, cotton goods, shirtings, sheet drillings, and overshirts, all of California manufacture, from the Oakland cotton mills; a large painting of a family group, by a Chinaman; section of the foundation of a railroad bridge, by Wm. Durber; argentiferous ore, from the Morning Sun ledge, by Mr. Cave, for R. P. Slade; photographs and drawings from Shubrickville, illustrating the engineering exploits by which the revenue cutter Shubrick was saved from destruction; and Varney & Rix's rock-breaker, which may be seen in operation this evening.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE & STEPHENS.

ON HAVING EMPLOYMENT.—No one has the right to complain of a want of employment of the kind he desires, unless he can make himself a necessity, and his services a desideratum, without which the employer cannot profitably get along. It is easy for any person of intelligence to become an expert in some particular art, trade, specialty or hobby, which he has pursued merely for his own pleasure, and at the same time to put himself and his acquirements into the category of financial desiderata. Young men may as well start off on the right principle; they will then work with enthusiasm, because it is a pleasure to them, and there will be somebody to derive a proportionable benefit from their assistance. "A knowledge of the means by which art and labor may be most successfully employed in the several departments of industry," is the definition given to those acquisitions which render the intelligent expert useful to his employer and to the community, and which distinguish him from the unambitious and unskilled hireling.

SUBLETT'S WINDOW SUPPORT.—Mr. Wm. A. Sublett has on exhibition at the Mechanics' Fair a full-sized window, provided with his improved catch, or window supporter, which he claims to be far superior to any other device for the same purpose in existence, and which is intended to do away with the cord and weight apparatus. Mr. Sublett, in his circular, gives numerous plausible reasons why his apparatus should be used in preference to any other. The device consists in letting into the frame, at the side of the window, a piece of metal which is provided with an inclined chamber, the deepest part being at the top. Inside this chamber is placed a round metal ball. The sash covers the chamber, and when it is pushed upward the ball is rolled up the incline into the deeper portion of the chamber, allowing the sash to raise easily; but the instant the upward pressure is discontinued, the ball drops down the incline and instantly binds against the sash, holding it securely. A strip of hoop iron is attached along the side of the sash, in order to prevent the wear which would result to wood on account of the friction produced by the ball. Persons will easily see its adaptability by examining the window on exhibition. Mr. Sublett has applied for a patent through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

WANTED—At this office, the postoffice address of Enraght Massey, late of Gold Hill, Nevada.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-aim

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16:16if

1 T
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and breaking out on any part of the body, and also removes pain of every name or nature instantly. It is a harmless liquid, and leaves no smart or stain, and is called Moore's Pain Paint. For catarrh and colds in the head, Moore's catarrh remedy affords a safe, sure and speedy cure. Both remedies sold by druggists everywhere, and at Moore's office, 652 Market street, northeast corner of Kearny, where all pain is instantly removed, free of cost, as hundreds can now testify from actual tests.

California Pioneer Fuse
MANUFACTURING COMPANY,
MANUFACTURERS OF
HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.
